and Nuclear Safety

The AMPOD project, project reference number (FKZ) 0327587 was funded by the Federal Ministry for the Environment, Nature Conservation and Nuclear Safety due to a decision of the German Bundestag. The sole responsibility for the content of the report lies with the authors.

This project was supervised by Project Management Jülich (PtJ).

TABLE OF CONTENT

1. SUMMARY	1
2. STATE-OF-THE-ART OF SCIENCE AND TECHNOLOGY	2
3. PROJECT AIMS	7
4. CO-OPERATIONS	9
5. DETAILED DESCRIPTION	10
5.1. Calibration of T-PODs	10
5.1.1. Introduction	10
5.1.2. Methods	10
5.1.3. Results	15
5.1.4. Discussion	17
5.1.5. References	18
5.2. Comparison of calibration procedures from NERI and GOM	19
5.2.1. Introduction	19
5.2.2. Methods	19
5.2.3. Results	20
5.2.4. Discussion	21
5.3. Calibration of C-PODs	22
5.3.1. Introduction	22
5.3.2. Methods	22
5.3.3. Results	25
5.3.4. Discussion	29
5.3.5. Conclusion	30
5.3.6. References	31
5.4. Intracalibration of T-PODs	32
5.4.1. Introduction	32
5.4.2. Methods	33
5.4.3. Results	38
5.4.4. Discussion	39
5.4.5. References	40
5.5. Deployment of T-POD pairs	41
5.5.1. Introduction	41
5.5.2. Methods	41
5.5.3. Results	43
5.5.4. Discussion	48
5.5.5. References	51

5.6. Analysis of T-POD-data with different parameters	52
5.6.1. Introduction	52
5.6.2. Methods	52
5.6.3. Results	53
5.6.4. Discussion	55
5.6.5. References	59
5.7. Comparison of C-POD and T-POD data with broadband recordings	60
5.7.1. Introduction	60
5.7.2. Methods	60
5.7.3. Results	61
5.7.4. Discussion	63
6. GUIDELINES	64
7. APPENDIX	66
7.1. Calculating sample size	66
7.2. History of ‘POD’ design, click detection, and other issues	70
7.2.1. Proto-POD and T-POD	70
7.2.2. C-POD	74
7.2.3. Future developments	79
7.2.4. References	79
7.3. Final symposium	81
7.3.1. Programme	81
7.3.2. Talk slides	83

1. Summary

In the expansion of regenerative energy, the offshore-wind farms take up a special relevance. Locations at sea benefit from a unique availability of wind energy, making them attractive for the installation of wind farms. However, construction and operation of a wind farm has an influence on the marine environment. Therefore applicants for wind farm projects in German waters are committed by the German Federal Maritime and Hydrographic Agency (BSH) to conduct an environmental impact study by regulations outlined in the “Standards for the Environmental Impact Assessment” (so called StUK3). Amongst others, the StUK is describing how to investigate the habitat use of harbour porpoises with the help of acoustic data loggers, the porpoise detectors (PODs). These devices register echolocation click sounds of porpoises, which are used for orientation and foraging as well as for communication.

The AMPOD-project “Application and analysis methods for the deployment of T-PODs in environmental impact studies for wind farms: Comparability and development of standard methods” aimed for developing standard methods and guidelines for the application of PODs in static acoustic monitoring (SAM) programs in environmental impact studies (EIS) for wind farms. The influences of technical as well as environmental parameters on the data gained were investigated with calibration and field trials. Furthermore, different analysis methods were compared. This knowledge helps for a better interpretability and comparability of results obtained in SAM studies. Cooperation with Danish, British and German institutes involved in SAM studies, mainly with regards to offshore wind farm EIS, gave a great opportunity to establish standard methods for conducting static acoustic monitoring.

In the final project phase, the results of the AMPOD-project and of recent POD-applications in SAM projects were presented at a symposium. Furthermore recommendations were developed, giving guidelines on how to conduct SAM with PODs and proposing a standard procedure for POD application and data analysis.

The results of the AMPOD-project show the importance of calibrating PODs. Adjusting the devices to a standard sensitivity helps to gather comparable data. A model is introduced that is applicable to align data recorded with PODs of different sensitivity deployed in shallow waters. In water depths of 20 m and more we found that T-PODs deployed at different depths retrieved significantly different data, caused by either the harbour porpoises' preference of sojourning at certain water depths or of thermoclines interfering with the detection abilities of the T-PODs. It is therefore important and recommended to keep the deployment depth of monitoring devices in a study constant. Above a certain level of background noise received by the monitoring devices, data will be affected by either the noise masking true detections or by a rise of the false detection rate. Analysis of data should therefore always consider the recorded background noise, and either exclude or adjust data retrieved at noise levels that affect data comparability.
