Abstract

Digital infrastructures have become indispensable in the field of modern research and science. These technological frameworks play a crucial role for the entire research cycle, supporting literature searches, aiding in data collection and analysis, facilitating the creation and publication of scholarly works, and ensuring the thorough documentation and long-term storage of research findings. Additionally, these infrastructures serve as a vital means for networking and communication among peers, creating the essential foundation of an open and transparent science and research ecosystem.

Helmholtz employees were invited to join the Helmholtz Open Science Forum "Towards Open Digital Research Ecosystems - Interconnection Infrastructures" on February 14, 2024, where options for the seamless integration of these digital infrastructures have been discussed. Speakers presented insights into diverse efforts to the provision of open infrastructure structures and how their interconnection offers new possibilities for seamless and integrated workflows within the increasingly digitized research. Further, it was examined how such an integrated ecosystem can support open science practices and vice versa

HELMHOLTZ

Open Science

Introduction

The Helmholtz Open Science Forum on the topic of “Towards Open Digital Research Ecosystems – Interconnecting Infrastructures” on February 14, 2024 was organized by the Helmholtz Open Science Office.

Together with the speakers (table 1) and more than 50 participants, approaches and perspectives for the development of open digital research ecosystems were presented and discussed.

The Helmholtz Open Science Forum offers an opportunity for exchange, networking, and information. This virtual event also served to maintain and create awareness of the topic of research evaluation within the Helmholtz Association.

This report documents the event; the slides of the speakers can be found in the appendix of this report (from p. 9 onwards).

Open Science

Documentation of the Forum

Introduction

Wolfgang zu Castell is heading the Department Geoinformation at the German Research Centre for Geosciences GFZ. Being chair of the Helmholtz Open Science Working Group, he has a broad expertise in various fields of open science. He further serves as member of the Steering Board of Helmholtz Imaging as well as of the Steering Board of the Helmholtz Metadata Collaboration.

In his talk he introduced the basic concept of Open Science. Since the research cycle is getting more and more digitized, there are increasing possibilities to take short cuts between the different stages of the research process and hook in on other steps while you are in the middle of the research process- in contrast to the learned linear following of the cycle. In doing so, he drew a line to the importance of open digital research ecosystems and possible perspectives regarding the establishment of infrastructures that allow these new ways of conducting research and how they can help to improve workflows and increase efficiency.

Open Access by DESY and the role of preprints¹

Robert Thiele has been working as a subject librarian in the library of Deutsches Elektronen-Synchrotron DESY since 2013. Moreover, he heads the Publishing and Publications team at the DESY library and he is responsible for the DESY publication server PubDB. The comprehensive management of information on publications can often be challenging. Especially, when channels outside the usual ways of scientific communication, like the publication of preprints via dedicated preprint-servers or other formats come into play. Questions besides a comprehensive publication record arise, like the connection of different states of a manuscript via different platforms, workflows for approval of early-stage publications or reporting procedures. Still, thinking outside the box and using innovative publication channels offers chances to increase visibility of research and the share of openly available publications. The presentation gave insights in the advanced workflows and strategies at DESY to handle diverse kinds of publications throughout different systems and how these systems are brought together to form an advanced ecosystem around the management and processing of information and publication.

¹The slides of this and all other presentations are attached to this document.

Open Science

Pioneering Digital Research Landscapes: Innovations at HZDR

Oliver Knodel has been working at the Helmholtz-Zentrum Dresden - Rossendorf (HZDR) since 2018 and has been head of the "Data Management and HPC" working group since 2022. He presented the data management systems and services of the HZDR including an overview of a self-developed control system called HELIPORT.

When dealing with research data management, researchers at Helmholtz-Zentrum Dresden - Rossendorf (HZDR) face a variety of systems and tools. These range from the project planning phase (proposal management, data management plans and policies), over documentation during the experiment or simulation campaign, to the publication (collaborative authoring tools, metadata catalogs, publication systems, data repositories). In addition, modern research projects usually are required to interact with a variety of software stacks and workflow management systems to allow comprehensible and FAIR science on the underlying IT infrastructure (HPC, data storage, network file systems, archives). HELIPORT is HZDR's approach to address this variety of requirements and give its users a streamlined experience when dealing with those challenges.

LabInfrastructure@Geo.X - A Search Portal for Laboratory Infrastructure

Manja Luzi-Helbing is scientific consultant at the GFZ German Research Centre for Geosciences in the Executive Board group Synergies and Networks. She presented the LabInfrastructure@Geo.X - a search portal for the laboratory infrastructure in the Geo.X network. It provides information on instruments, analytical methods, contact persons, links to the laboratories' websites, and key and data publications. The knowledge of the network's laboratory infrastructure and its access options supports collaborations and joint projects. The portal includes over 220 entries from all nine Geo.X partner institutions and is continuously expanding.

As part of the Helmholtz DataHub initiative at GFZ, LabInfrastructure@Geo.X was developed as a service designed to enable role-based curation of information about the laboratory infrastructure, which can be made available in a search portal. LabInfrastructure@Geo.X is customized to the needs of the Geo.X network, but its concept is compatible with multiple institutional or network environments within Helmholtz and beyond.

LabInfrastructure@Geo.X is being integrated into the digital research ecosystem at GFZ cooperating with other services such as GFZ Data Services, the Sensor Management System and the HMC project ALAMEDA. It is also embedded into the NFDI4Earth landscape and supports the international initiative OneGeochemistry. In this context, parts of the vocabulary developed for LabInfrastructure@Geo.X were integrated into a common conceptual scheme for analysis methods in geochemistry and cosmochemistry which was published at Research Vocabularies Australia.

HELMHOLTZ

Open Science

Technical key elements:

- Web-based user interface (change request form) for the submission of new or modified laboratory metadata. A controlled set of vocabulary derived from the NASA GCMD instrument keywords and a vocabulary adapted for the Geo.X network is used for keywording instruments and analysis methods.
- Management interface which facilitates decentralised editing and maintenance of the laboratory metadata
- Semantic search options and filter functions aligned with the needs of the scientific target groups.

The Open Infrastructure Portal for DESY and HIFIS

Tim Wetzel is a research associate at Deutsches Elektronen-Synchrotron DESY at the IT department. Since 2020 he is working on AAI, research data management and data transfers as well as cloud solutions for scientific web services. He presented a concept of the Open Infrastructure Portal for DESY and HIFIS.

The portal makes open data accessible to scientists and to the public. It will consist of three components that interface directly with each other. The data catalog "Scicat" is used to make data sets available including technical and scientific metadata as well as how to access them. The data sets themselves are stored on a "dCache" instance, a storage system that is widely used in the high-energy physics community. Upon reasonable request computing resources and storage access can be provided via DESY's VISA portal that allows data and compute access including pre-installed analysis tools via a graphical user interface in the browser.

The installation of this portal package is performed together with colleagues from DAPHNE4NFDI and will be a way to make data sets not only public but also FAIR.

Replicable image analysis across domains

Deborah Schmidt is head of the Helmholtz Imaging Support Unit at the Max Delbrück Center for Molecular Medicine in Berlin. She provided insights into the Helmholtz Imaging Support Unit.

Imagine a biologist trying to understand cell behavior by looking at organelle structures in 3D but running into issues with making the process reliable. At the same time, a materials scientist is trying to see the tiny details of metals and faces similar problems. How can they benefit from each other's learning processes? Helmholtz Imaging, bridging diverse scientific domains, leverages its unique position not only to identify common bottlenecks in the imaging pipeline but also to facilitate the exchange of solutions across fields. This presentation will explore the journey of Helmholtz Imaging Support scientists deploying user-friendly, accessible technologies and strategies that cater to the immediate needs of researchers across domains. Their experience reinforces the vital role of a supportive, adaptable framework, complementing the longer-term pursuit of cross-domain standards.

HELMHOLTZ

Open Science

The iDAI.world: an interconnected research infrastructure in an open science world

Fabian Riebschläger is head of the Research Data Management department at the Central Scientific Services of the German Archaeological Institute (DAI). In his presentation, he introduces the digital integrated information system for ancient studies "iDAI.world". It is operated by the DAI, a globally interconnected research institution formally associated with the Federal Foreign Office and dedicated to archaeology and ancient history. The iDAI.world consists of a series of interconnected systems and functions as a digital research environment, offering tools and repositories to facilitate the collection, documentation, storage, analysis, visualization and publication of research data. Multilingualism and worldwide accessibility are underlying principles of iDAI.world

This presentation provided a general overview of iDAI.world. The emphasis was on the connection of the individual data records that are stored in independent databases of the respective systems through the use of standardized data and a very structured approach.

SciLake: Assisting domain-specific applications on top of open SKGs - The OpenAIRE Graph use-case

Paolo Manghi is the Chief Technology Officer of OpenAIRE AMKE and responsible for the OpenAIRE Graph. He is involved in coordination and/or research activities in EOSC-related projects and he presented the concept of SciLake.

SciLake builds upon the OpenAIRE ecosystem and EOSC services to enable creation, interlinking, and maintenance of Science Knowledge Graphs (SKGs) and execution of data science and graph mining queries on top of them unlock the vast scientific knowledge space with advanced, AI-based services that exploit customized perspectives. The OpenAIRE Graph is an SKG in support of Open Science publishing discovery and monitoring, used by researchers, organization, ministries, and funders for their scientific experiments, data analysis, impact and monitoring of investments. This presentation will present SciLake, its objectives, and the contribution to its activities, both as provider and consumer of data, of the OpenAIRE Graph.

HELMHOLTZ

Open Science

Summary and Outlook

The event showed that there are manifold approaches to interconnect stand-alone silo-like infrastructures. This enables researchers, institutions or the society in general to link data and (meta-)information, find previously unknown connections between previously unconnected facts, find new and effective ways to manage digital workflows and thus optimize their work in administrative or research contexts.

The events have shown that these approaches can work with very different levels of complexity. It was made clear that some very basic requirements must be met for the successful implementation of such networked infrastructures.

To bring infrastructures together there is, for example, a need for persistent identifiers, which are a crucial element in many projects, as they enable the unique and permanent location of resources and enable knowledge graphs for structured and networked presentation of scientific information. Standardization through metadata and metadata schemas also plays a central role in linking information systems. In direct relation to this the use of common terminologies is needed to overcome information-silos. Ontologies can help here to make infrastructures speak the same language and enable them to get in exchange with each other to connect heterogenous artifacts of the same contexts. Furthermore, the urgent need to use open source systems was emphasized in order to be able to change and adapt the interfaces for the automatic exchange of information between the infrastructures. Moreover, it was emphasized that such systems - especially if they are made available to a wider public - require the necessary technical basis to be able to handle the tasks in different areas and at different scales. Against this background, suitable governance models must also be developed and applied. The importance of developments for European and international networking and interconnection was also underlined.

It became clear that there are many questions around open and interconnected infrastructures to be answered, but various Helmholtz Centers are developing specific approaches. Connecting platforms such as HIFIS or Helmholtz Imaging form a link and can support these developments. This forum marked a first step to discuss and coordinate respective efforts in Helmholtz and to bring people together. Further efforts are needed to connect people, approaches and ideas around this topic and to advance the idea of interconnected digital research ecosystems at Helmholtz and beyond.

Towards Open Digital Research Ecosystems

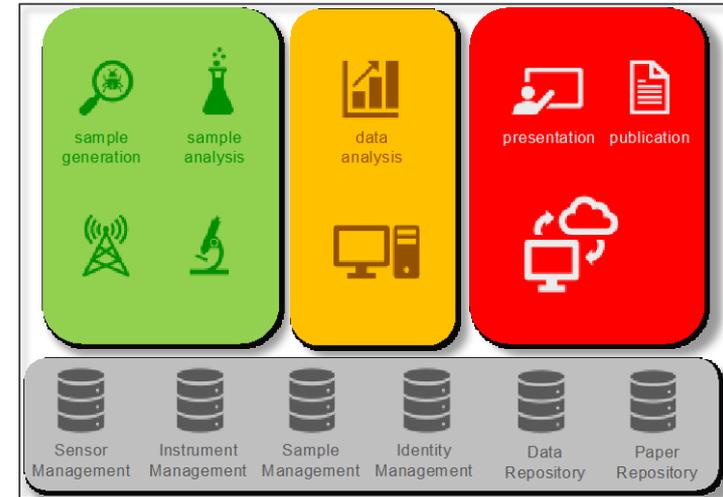

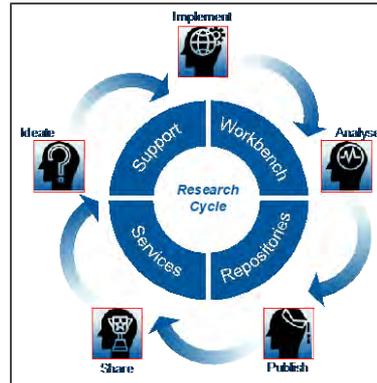

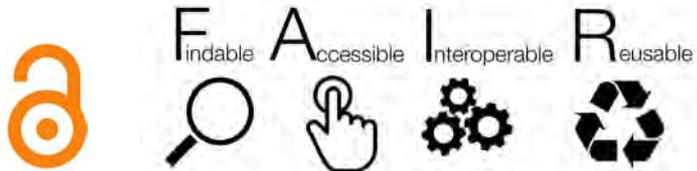

Open Science Forum

February 14, 2024

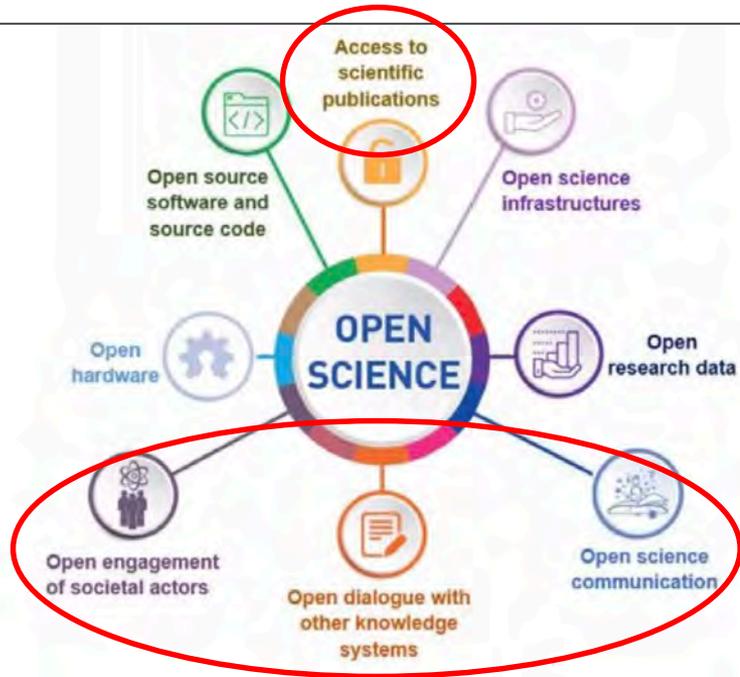

Wolfgang zu Castell
Department Geoinformation, GFZ

Open Science ...

- is **not** Open Access
- is **not** FAIR
- is **fundamental** to the scientific method
- is fostering **digitalization**
- is also aimed at **non-scientific stakeholders**

Open Science ... the UNESCO approach

- much broader view
- including societal engagement
- building on dialogue

... thinking digitalization, this heavily relies on infrastructure!

Basis is laid out for a broader approach

HELMHOLTZ

S. Dallmeier-Tiessen | CERN OS Policy

„*Openness by design*“ as
guiding principle for building
a **Digital Research Ecosystem**

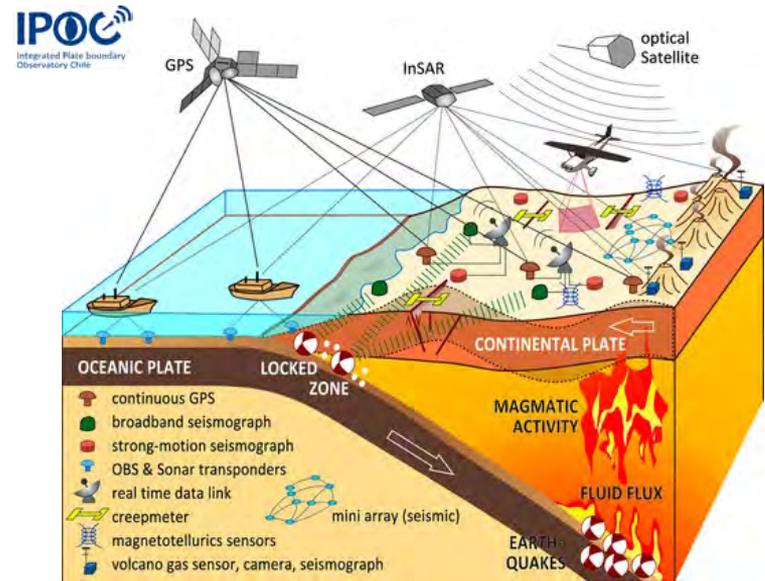

An Example: Earth System Science within Helmholtz

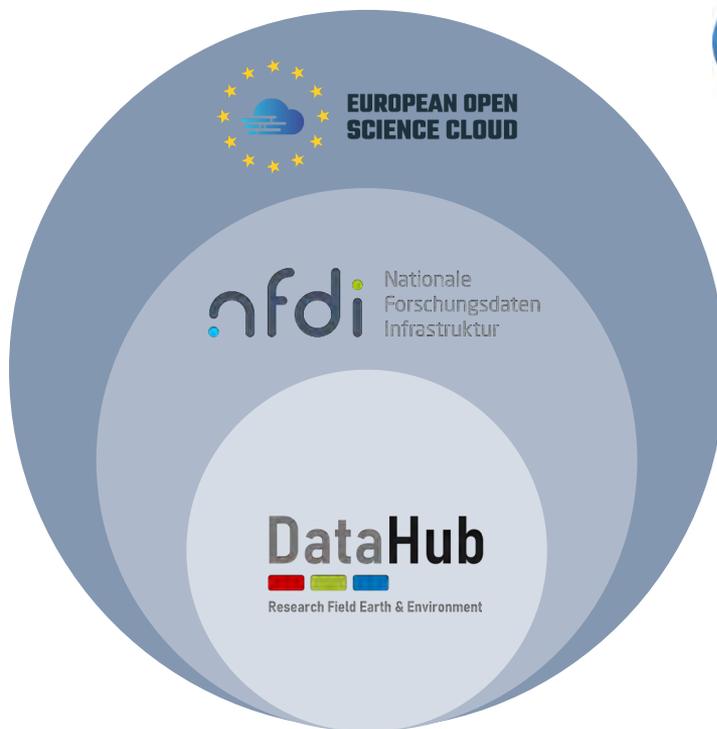

We are working in cross-disciplinary teams within international networks!

- need to bring together data and models
- scientists want immediately explore (i.e. work with data and models)
- prepare ourselves for new technologies (e.g. AI)

(Open?) Digital Research Ecosystem

- there are many initiatives with similar goals
- there are stakeholders outside of academia
- we must avoid to plant just yet another little plant in the jungle

Infrastructure for Open Science ...

DataHub E&E/GFZ

within the digital ecosystem we find

- ✓ services dealing with the digital artefacts of the research process
- ✓ services enabling access, processing, storing, archiving ...
- ✓ services enabling identification, harmonization, findability ...

open science
infrastructure

infrastructure
for
open science

Questions for Open Science ...

- What infrastructures are **essential for open science**?
- How do we organize and guarantee **long-term sustainability**?
- How far are we able to go in terms of **open infrastructures** (end-to-end)?
- To what extent do we need to **harmonize** policies, guidelines, concepts, architectures?
- How do we deal with the **increasing level of automatization**?
- How do we deal with **new challenges** (see e.g. chatGPT et al.)?
- How do we deal with **threats** (e.g. IT security, geopolitical changes)?

Open Access by DESY and the role of preprints

Report No.: DESY-23-133; arXiv:2309.08604

Abstract: Event generators like Pythia play an important role in physics studies at the Large Hadron Collider (LHC). While they make accurate predictions in the central region, i.e. at pseudorapidities $\eta < 5$, a disagreement between Pythia and measurements in the forward region, $\eta > 7$, has been observed. We introduce a dedicated forward physics tune for the Pythia event generator to be used for forward physics studies at the LHC, which uses a more flexible modelling of beam remnant hadronization and is tuned to available particle spectra measured by LHCf. Furthermore, we provide an uncertainty estimate on the new tune in a data-driven way which can be used as a means of flux uncertainty for future forward physics studies. We demonstrate an application of our tune by showing the updated neutrino and dark photon spectra at the FASER experiment.

Keyword(s): PYTHIA; particle spectrum; photon spectrum; neutrino spectrum; CERN LHC Coll; Monte Carlo; LHC F; flux; hadronization; rapidly; central region; forward production.

Pioneering Digital Research Landscapes: Innovations at HZDR

Towards Open Digital Research Ecosystems – Interconnecting Infrastructures, Open Science Forum, February 14, 2024

Oliver Knodel // contact: o.knodel@hzdr.de

Our Research Facility and our Large Scale Research Infrastructures

The Helmholtz-Zentrum Dresden - Rossendorf

— Employees approx. 1,470. Thereof 670 scientists

— **HELMHOLTZ**
RESEARCH FOR GRAND CHALLENGES

Research Fields

— Energy, Health and Matter

ELBE – Center for High-Power Radiation Sources

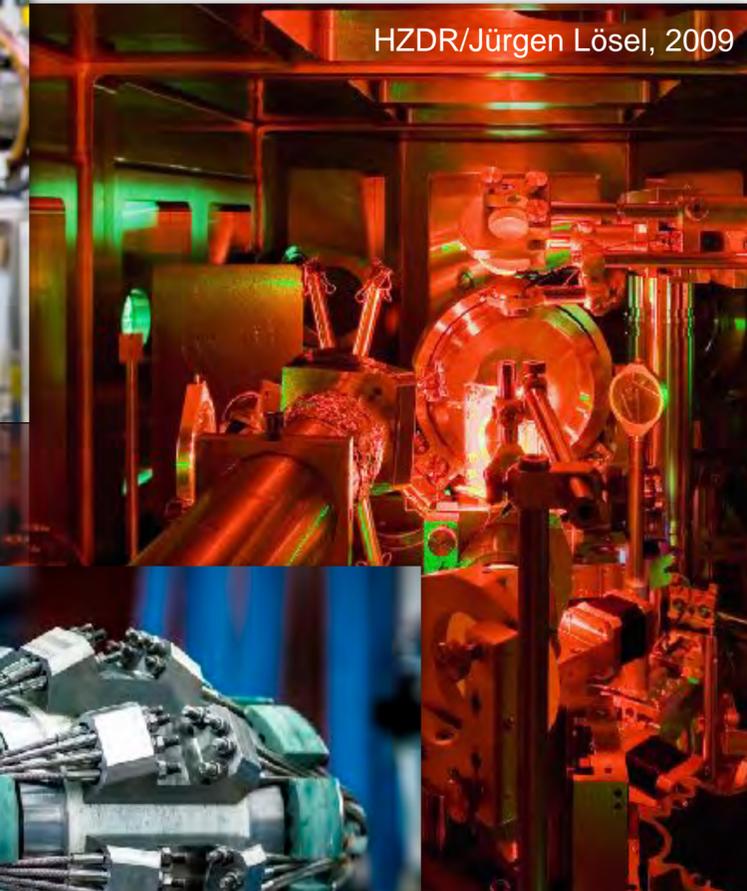

- Electron accelerator, free-electron lasers & THz source.
- Positrons, protons, neutrons as well as X-ray and gamma radiation

Dresden High Magnetic Field Laboratory (HLD)

— Europe's highest pulsed magnetic fields

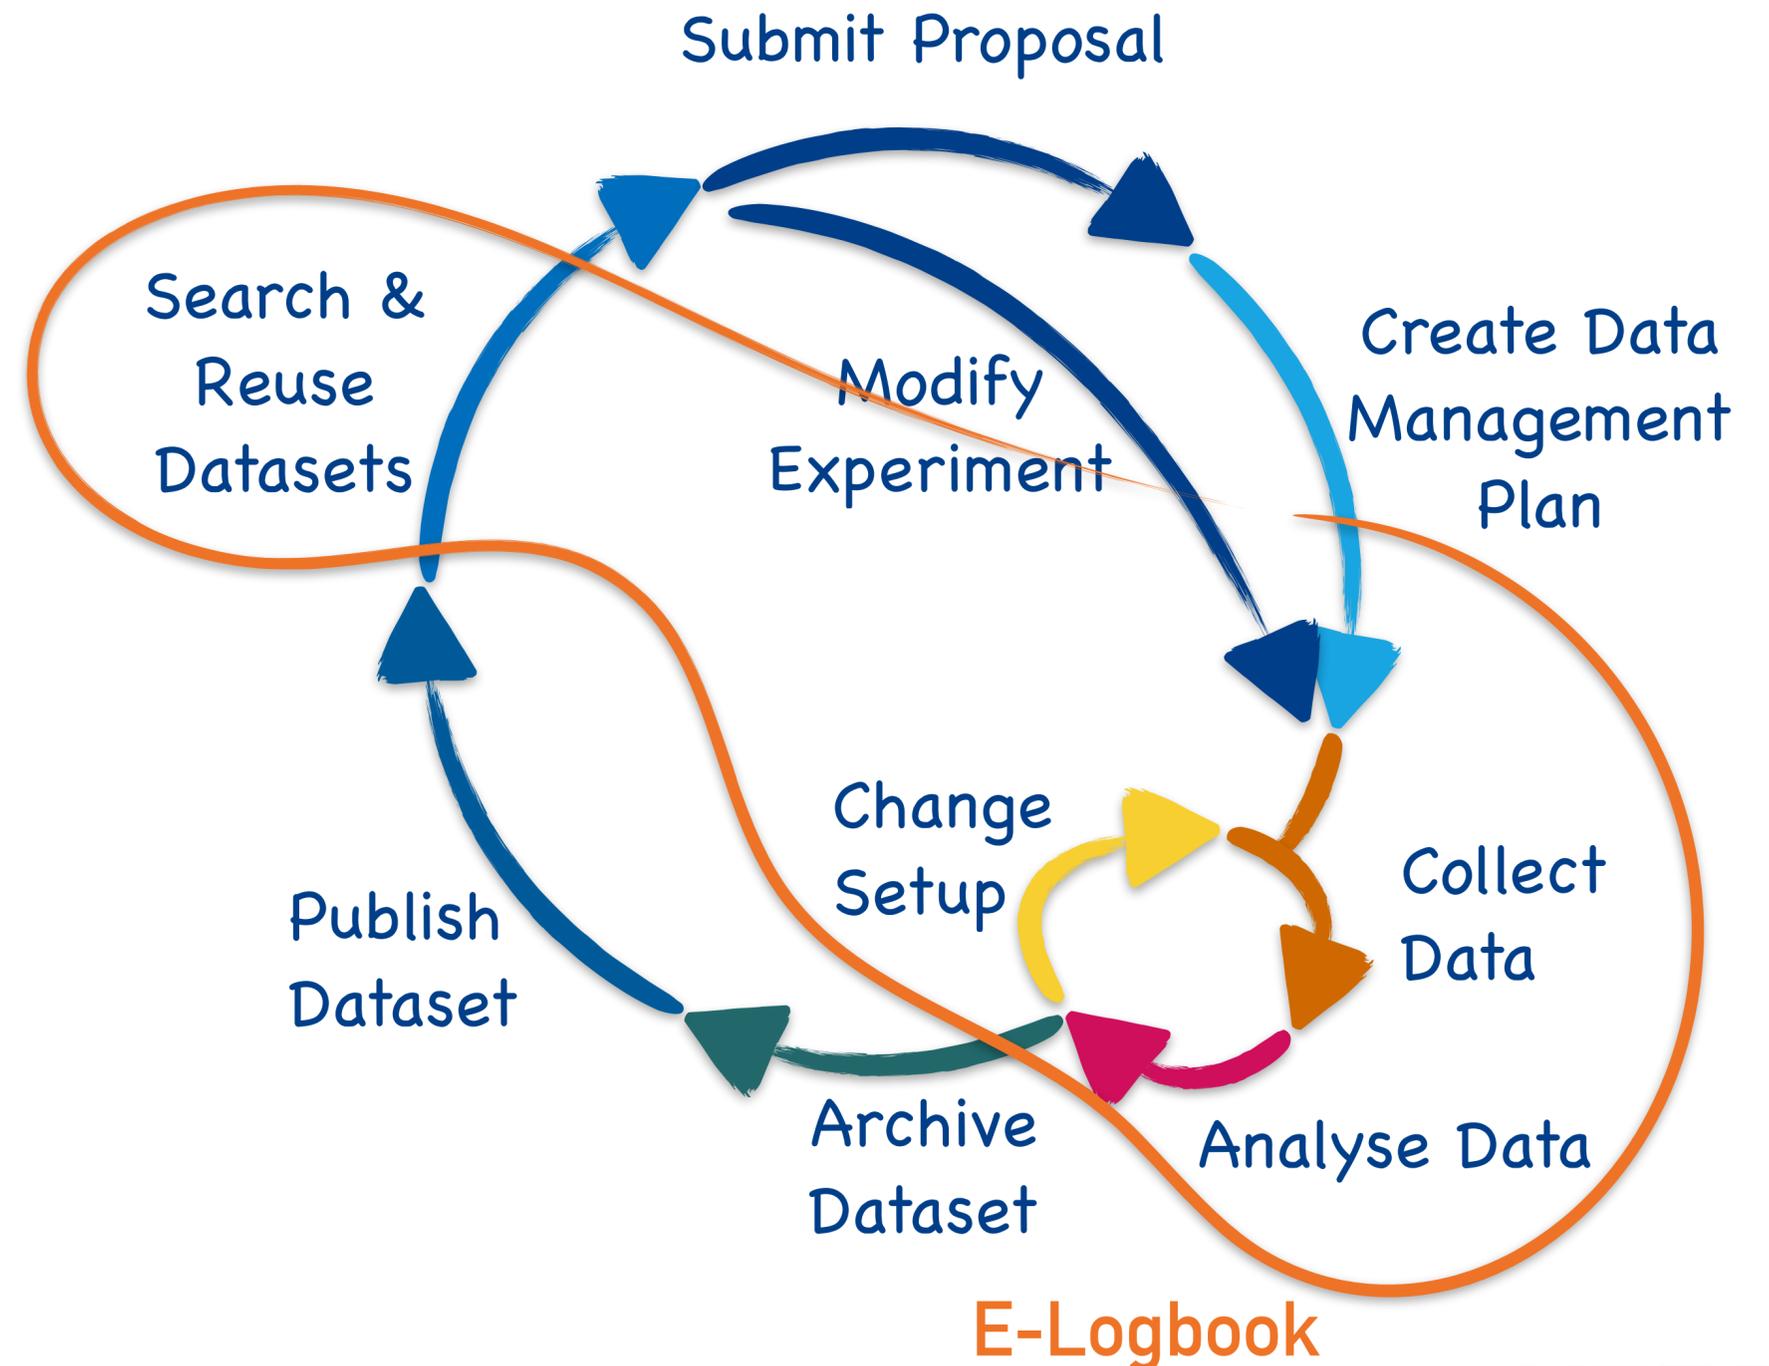

Ion Beam Center (IBC)

— Nanoscale surface analysis and modification

Our Challenge: An End-to-End Digital Data Lifecycle

- We support many steps of our different research experiment (matter, energy and health) with a wide range of tools:
 - Electronic lab notebook (**E-Logbook**),
 - Interactive analysis,
 - **FAIR Publication** of datasets,
 - Scientific **workflow** management,
 - **Handle** (PID) generation and management.
- A uniform and smooth access to and **between** all services and systems in our ecosystem is necessary.
- The documentation of all these linked resources is essential to create a **comprehensible** and **FAIR** data lifecycle.

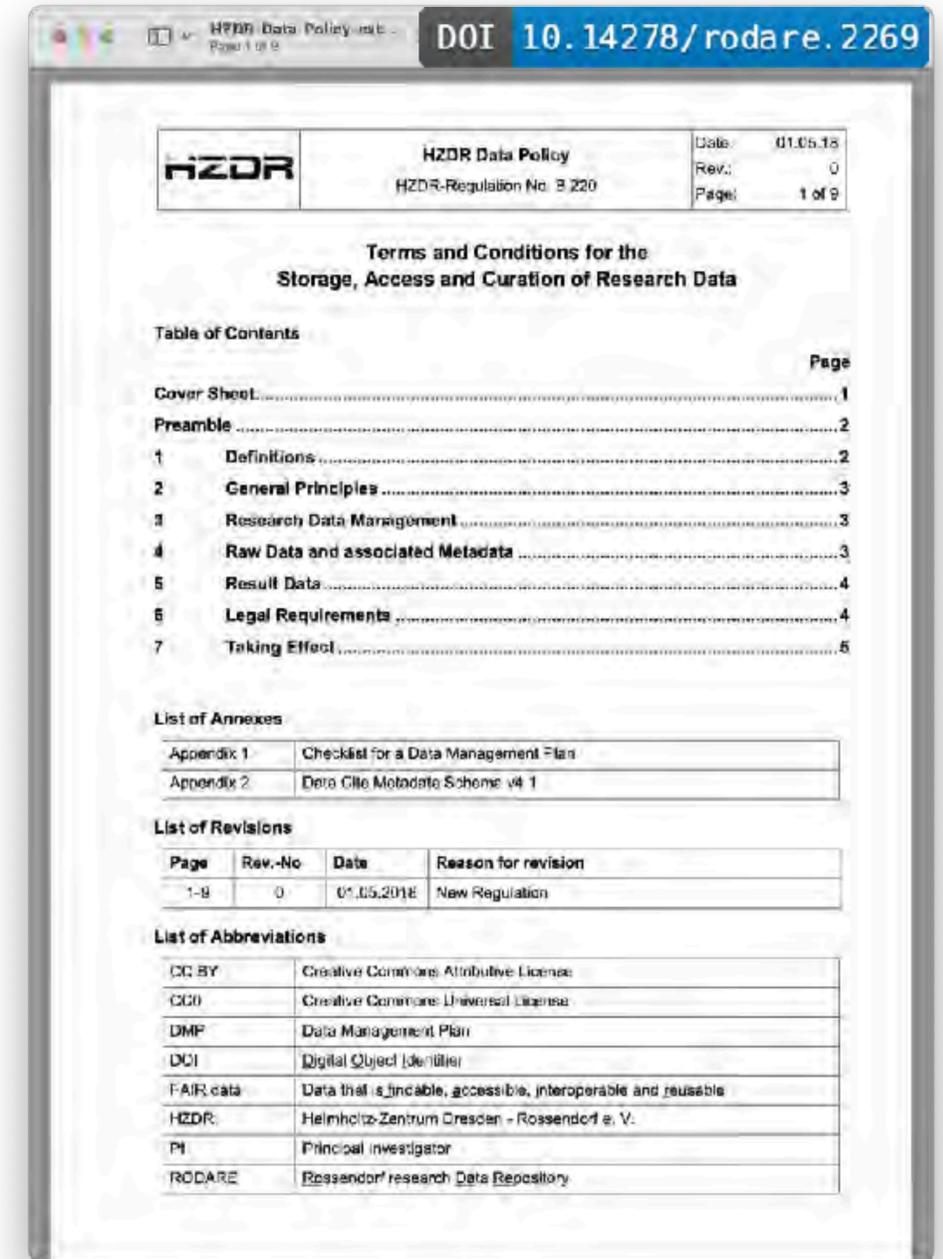

The Foundation for our Digital Data Lifecycle: HZDR Data Policy

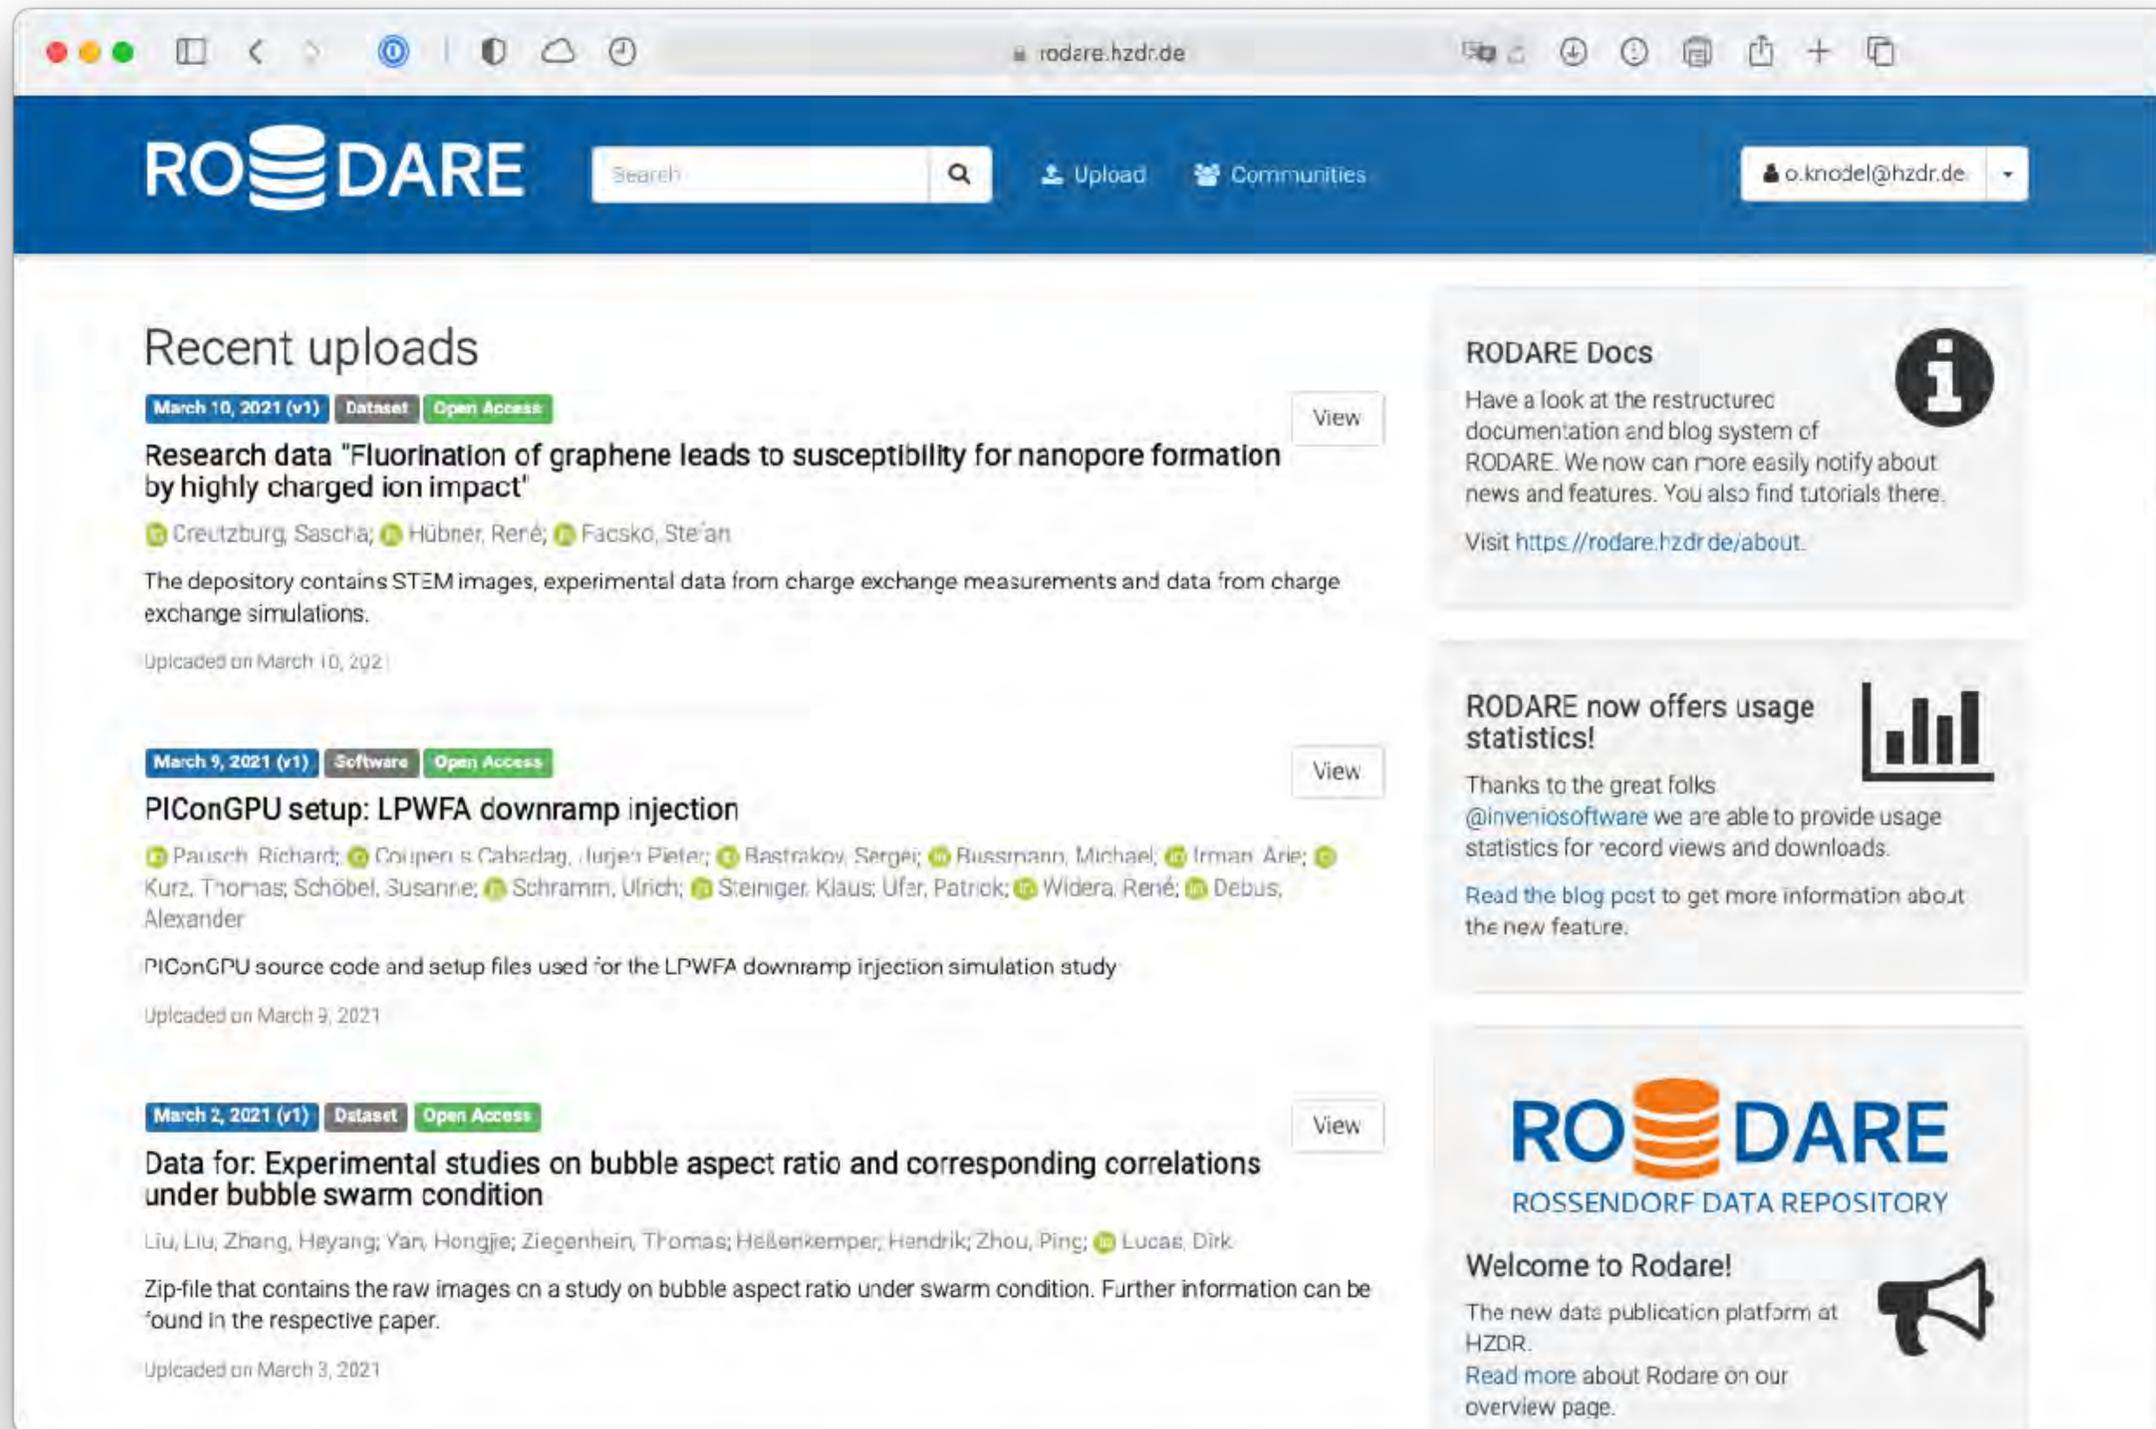

- The HZDR has a data policy since **May 2018**
- Reasons for the development:
 - Legal framework for data management and publication,
 - Establishment and legitimisation of coordinated research data management at HZDR,
- Foundation for the development of tools and services to support our scientists:

© Helmholtz-Gemeinschaft 2023,
<https://os.helmholtz.de/open-research-data/forschungsdaten-policies/>

Starting Point in 2018: Data Publication Platform RODARE rodare.hzdr.de

Powered by:

Registered in:

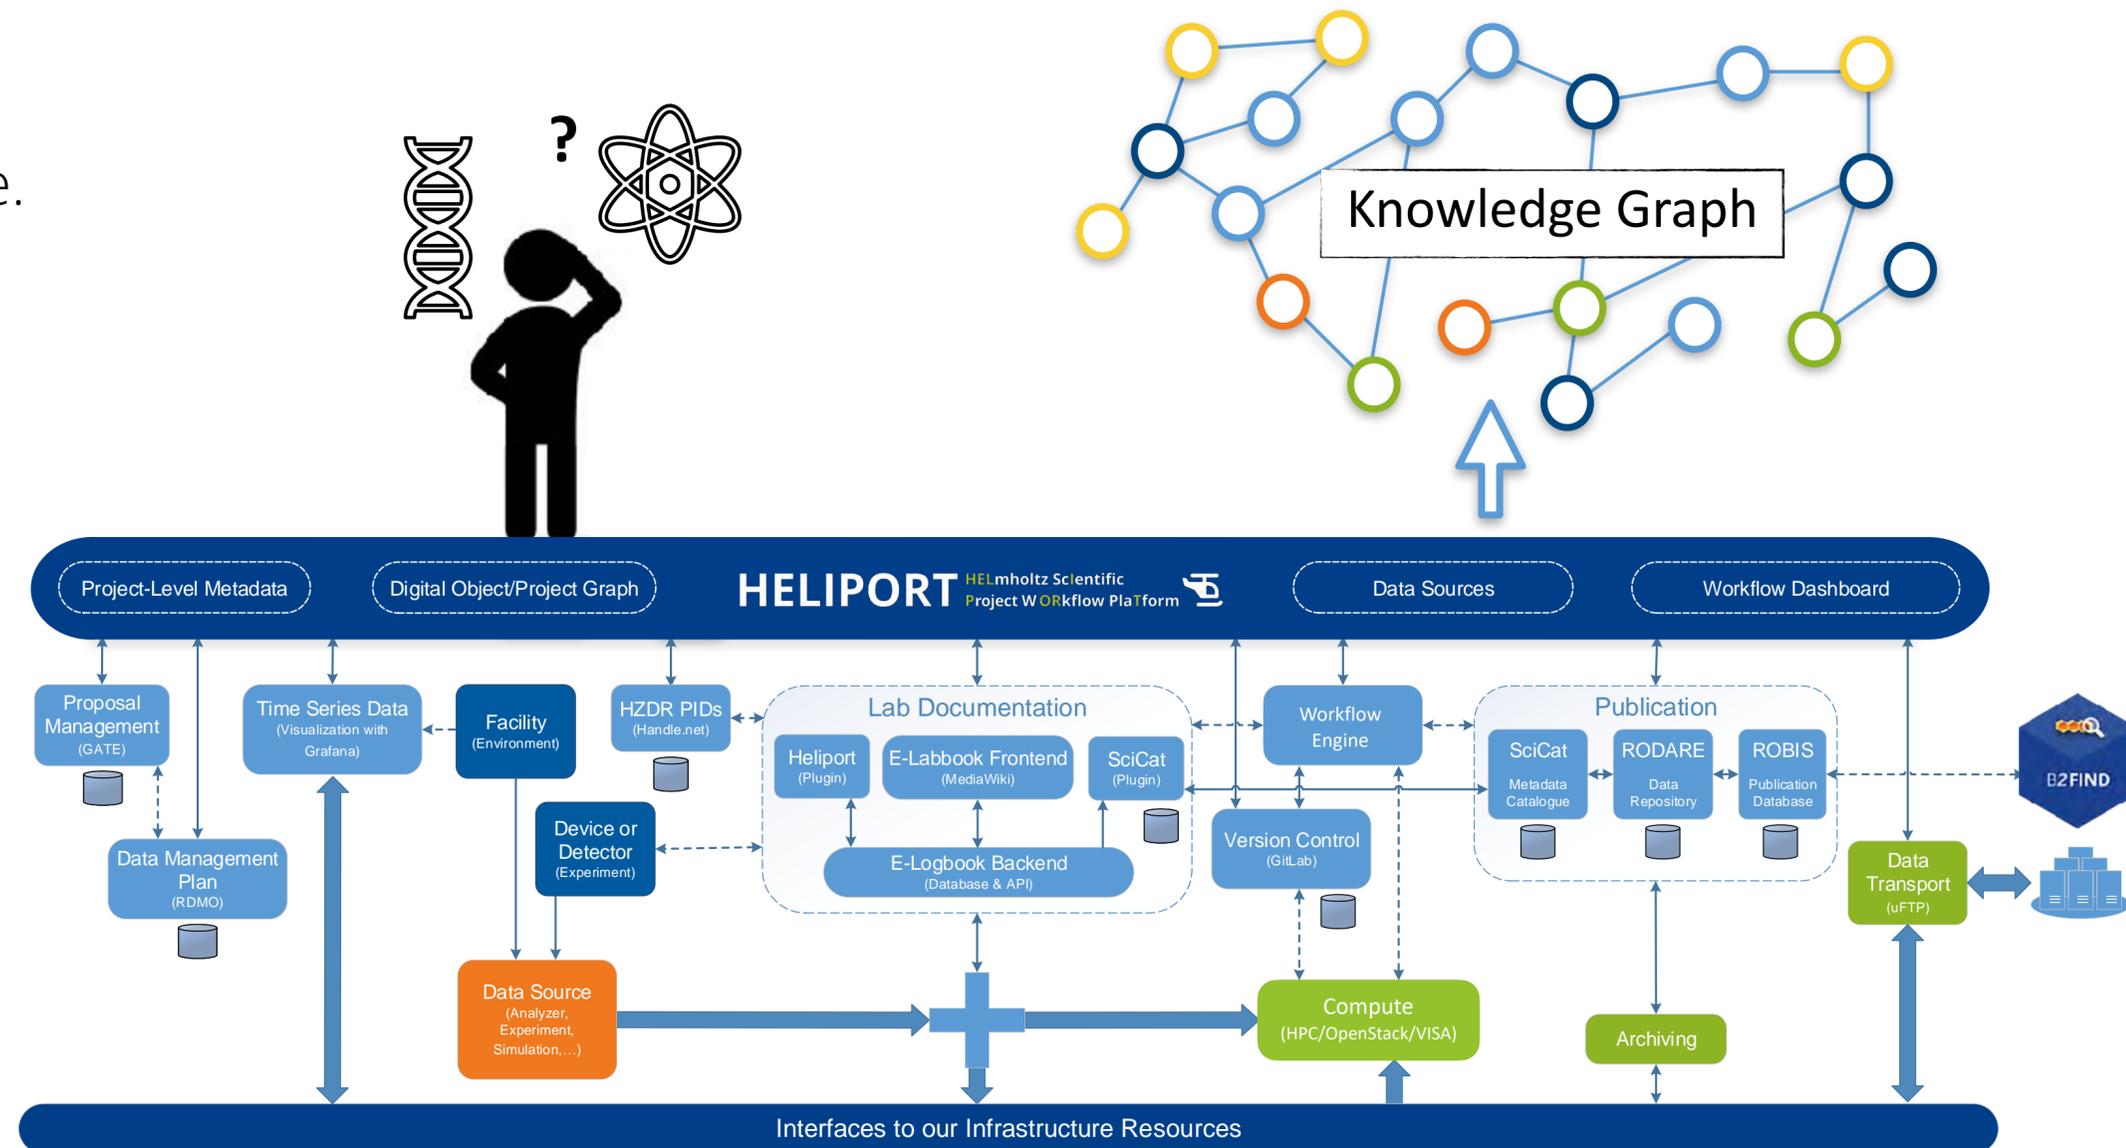

<http://doi.org/10.17616/R3BR40>

Findable with:

Our Observations Over the Following Years...

- We need to support the entire experiment with reliable **interconnected tools** to enable comprehensible and FAIR science.
- The resulting IT infrastructures are complex.
- Documentation is necessary, but typically time is missing.
- Scientists often don't know which services are available at facilities and how to use them.
- An overarching system **guiding our scientists** (and visitors) through the lifecycle of their research project is essential.

“ The HELIPORT project aims at developing a platform which accommodates the **complete life cycle** of a scientific project and links all corresponding programs, systems and workflows to create a more **FAIR** and comprehensible project description.

Requirements and Expectations

- HELIPOINT was intended to provide only the **proposal's metadata**, from internal and external scientists, to allow the assignment of resources.
- Over time, we realised that HELIPOINT can also answer our scientists' most important questions, such as:

How can we **automate recurring processes** and keep track of status and data products?

How can we bring **new team members** or **visiting/external scientists** into our project lifecycle and all associated tools?

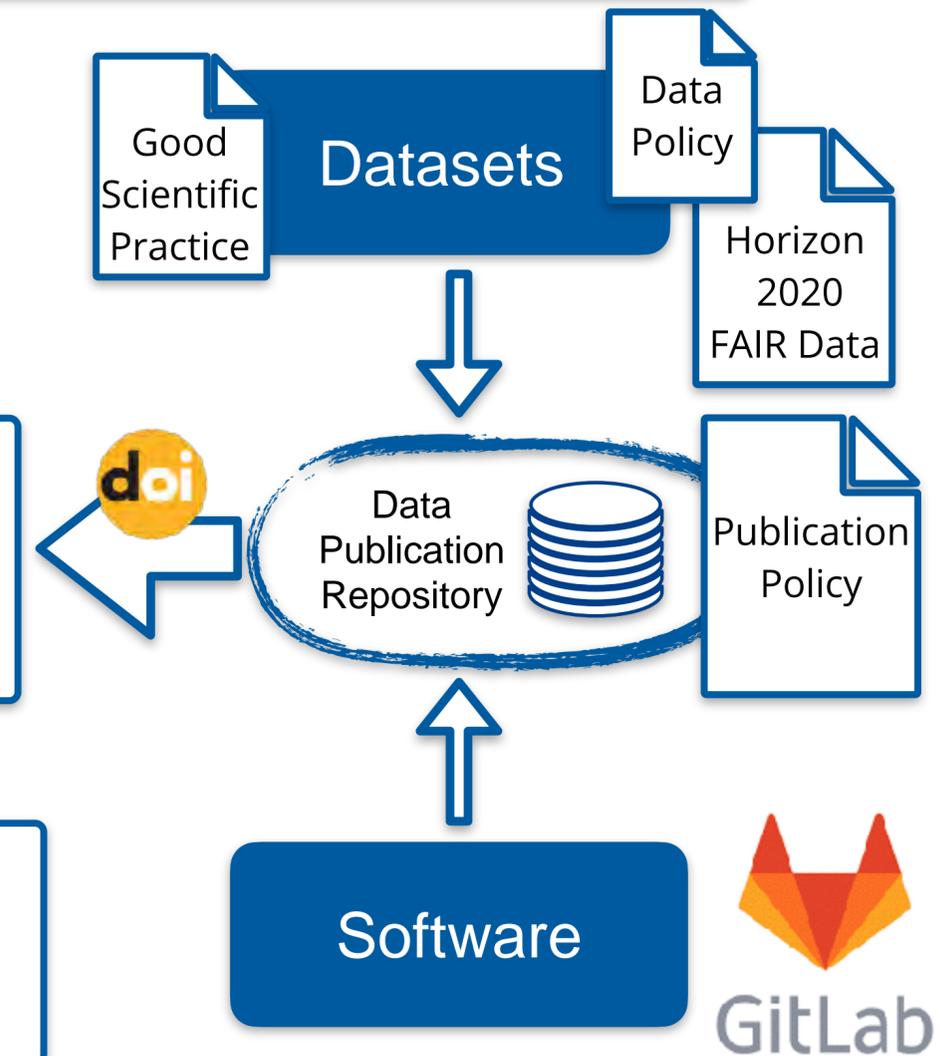

And how we can support them?!
What are the necessary steps towards a full comprehensible and FAIR research experiment ensuring data provenance?

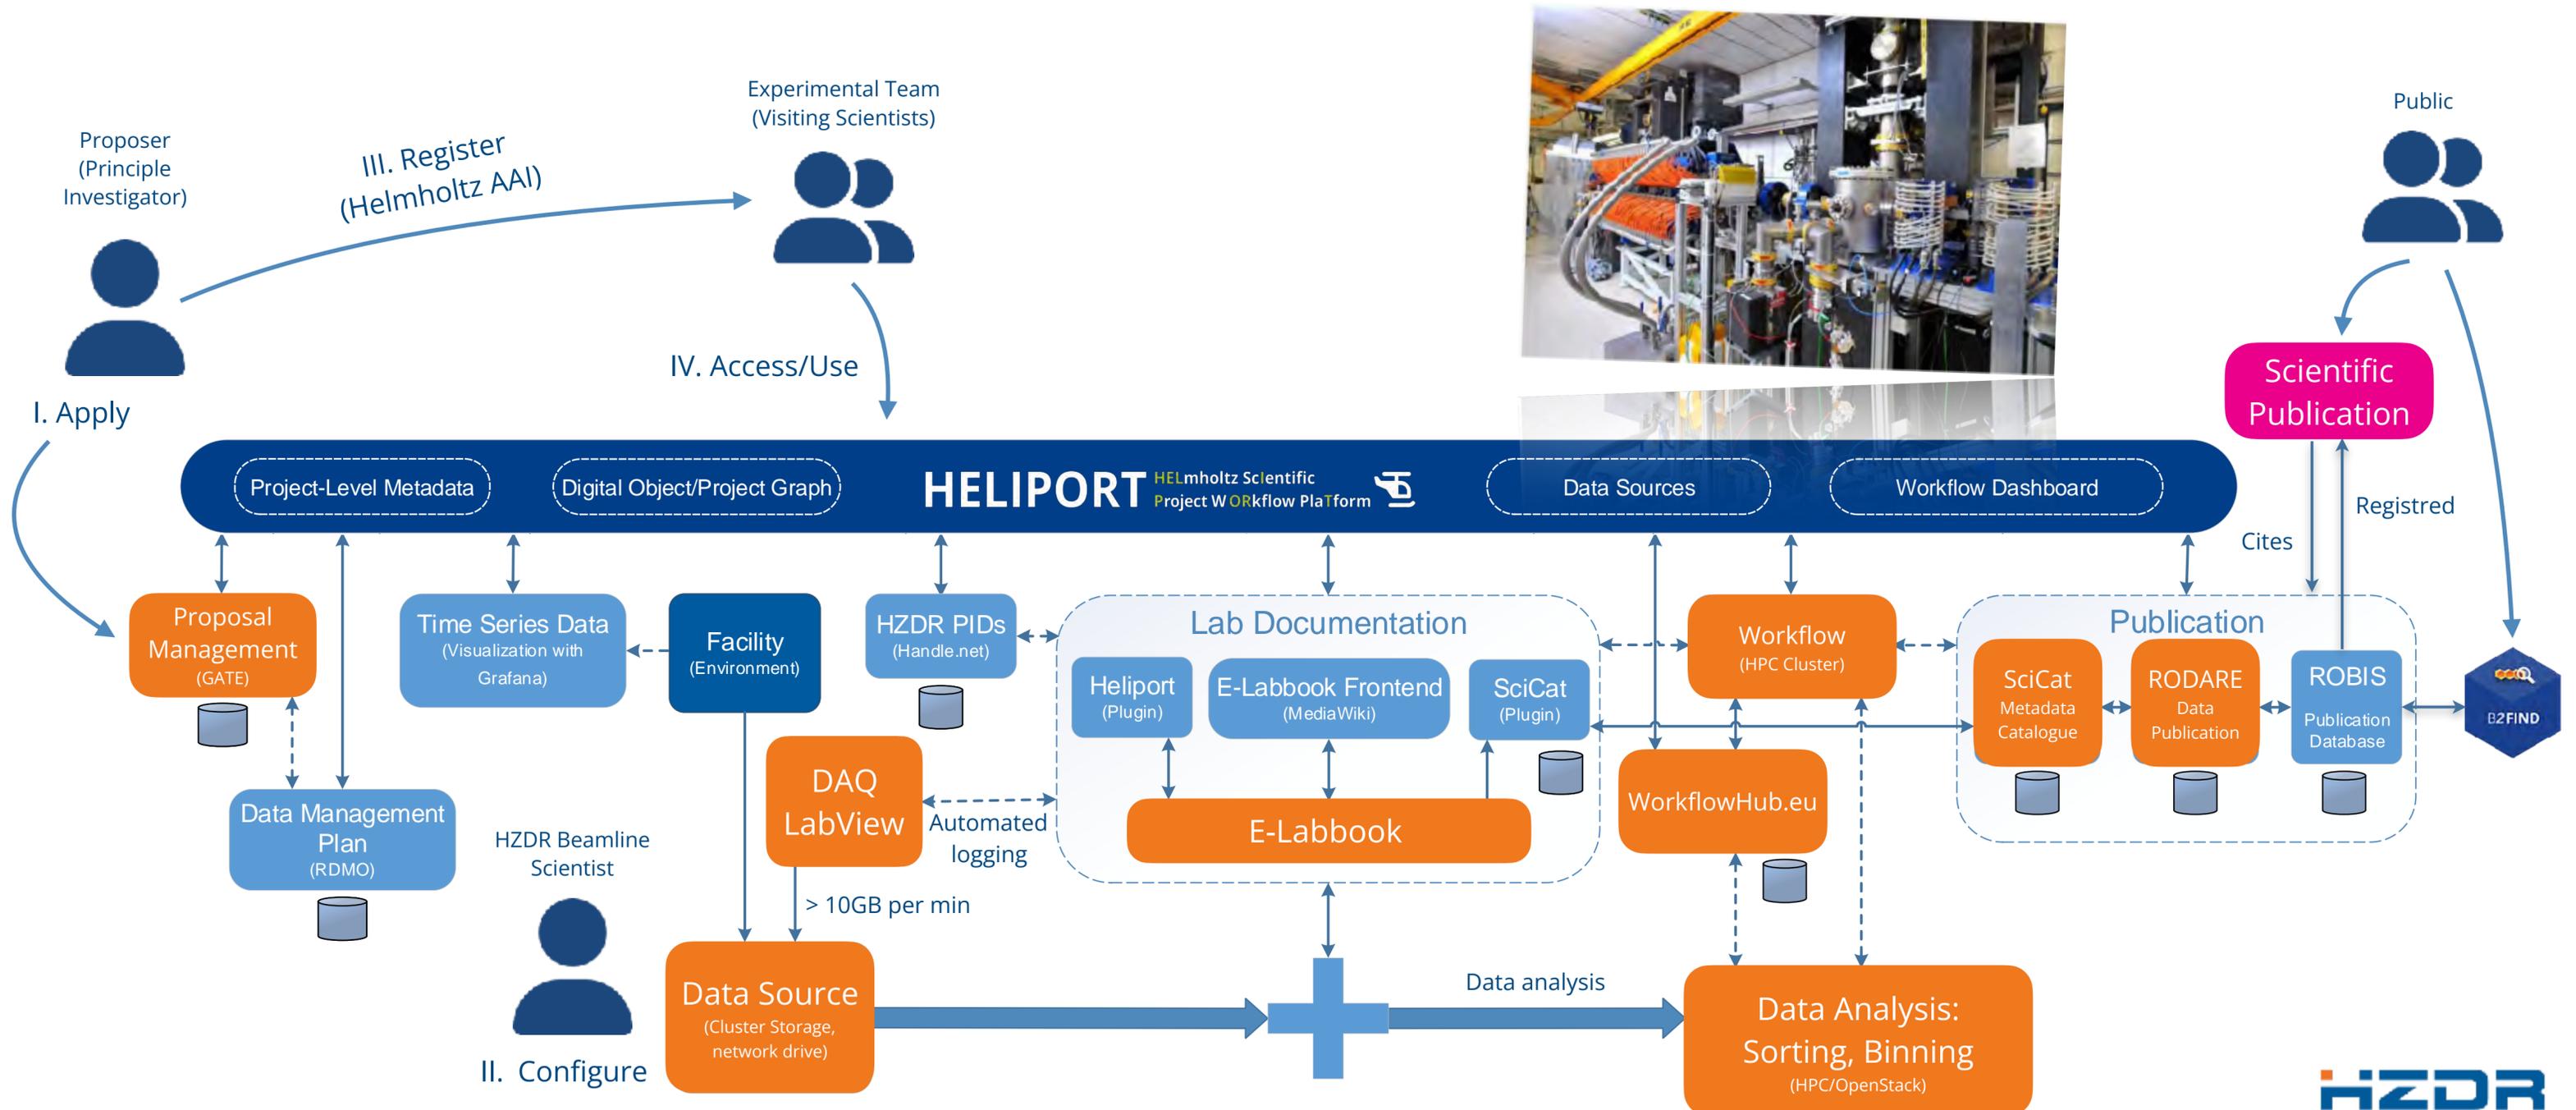

Which datasets or software can be **published** (and how)?

Where are data, software and how can I gain **access** to both of them?

Example: HELIPORT Supported Experiment at The TELBE Beamline

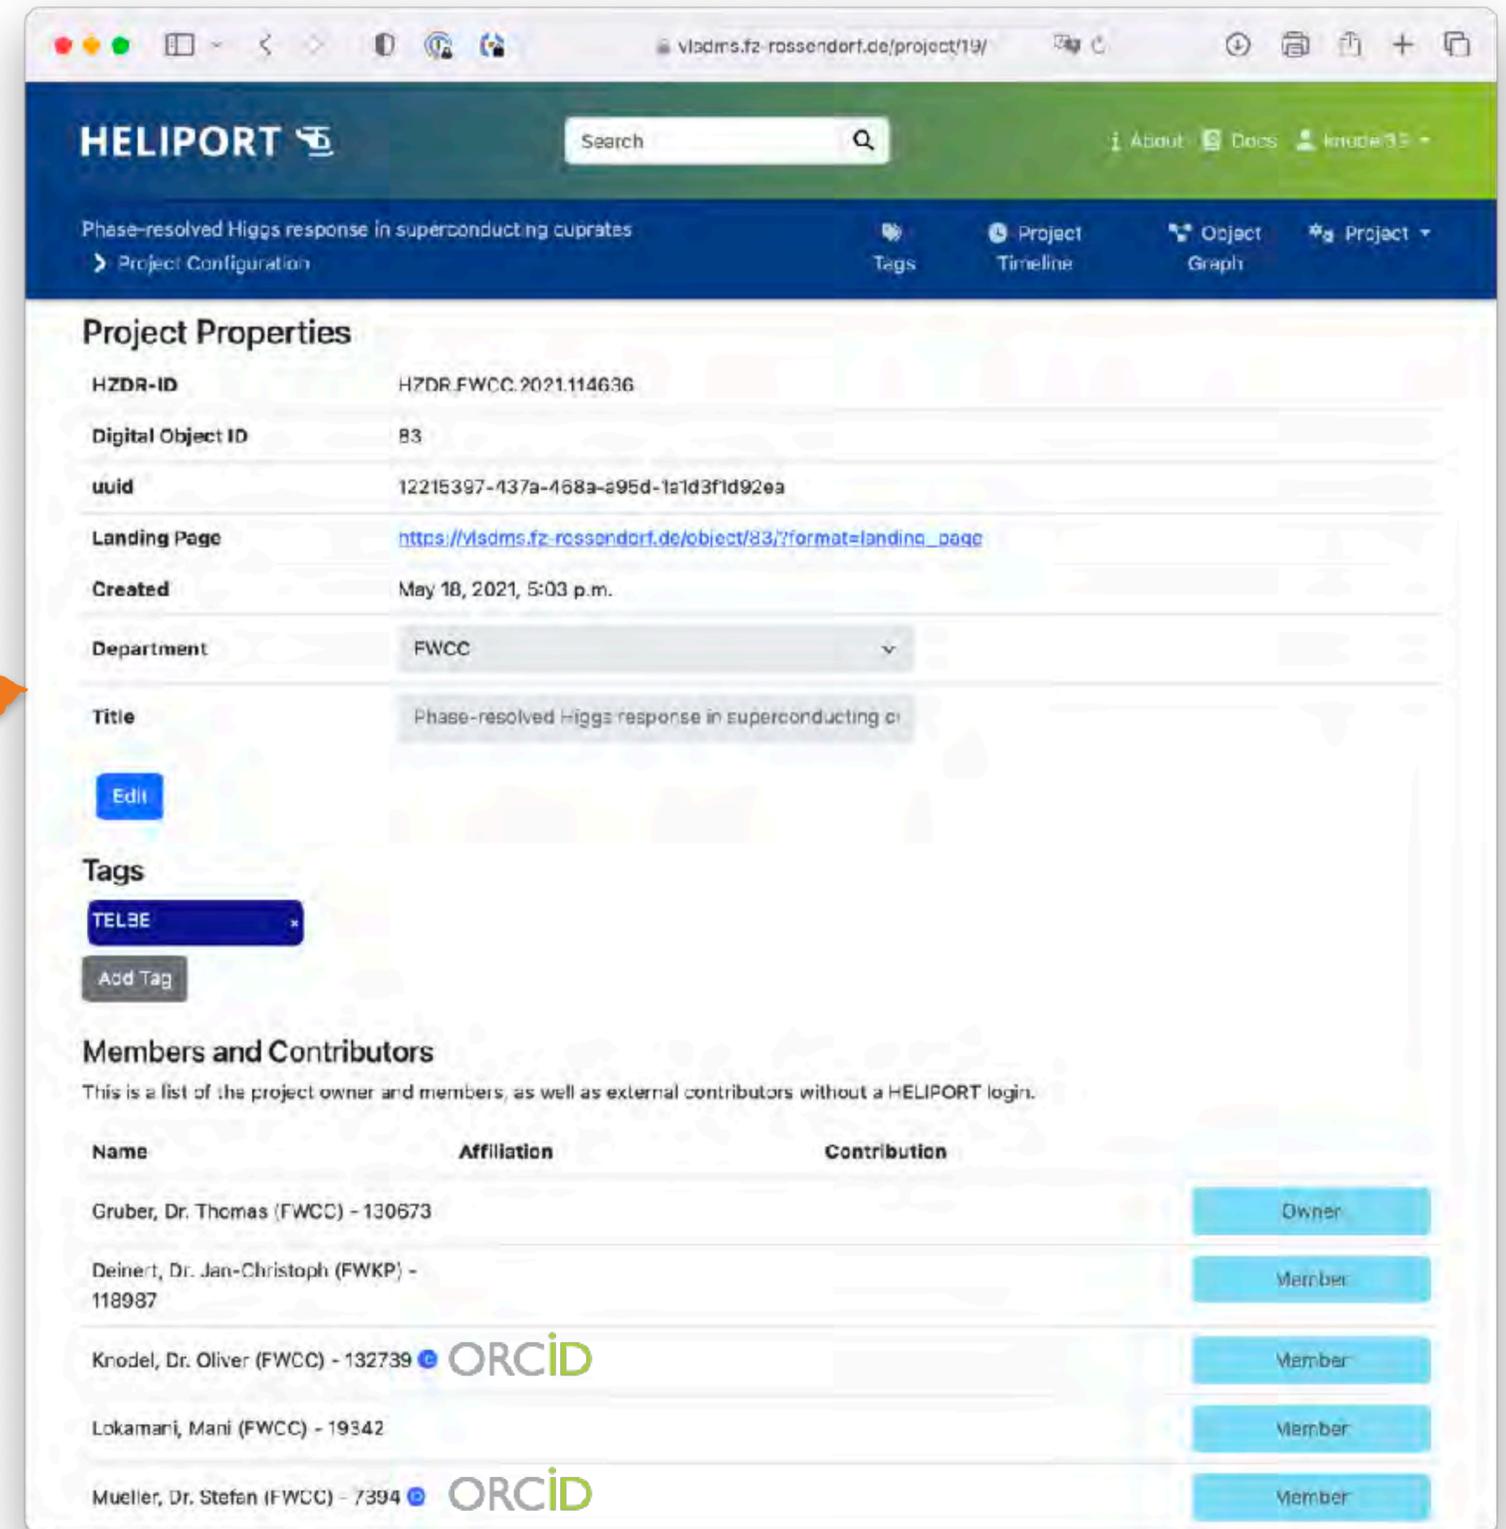

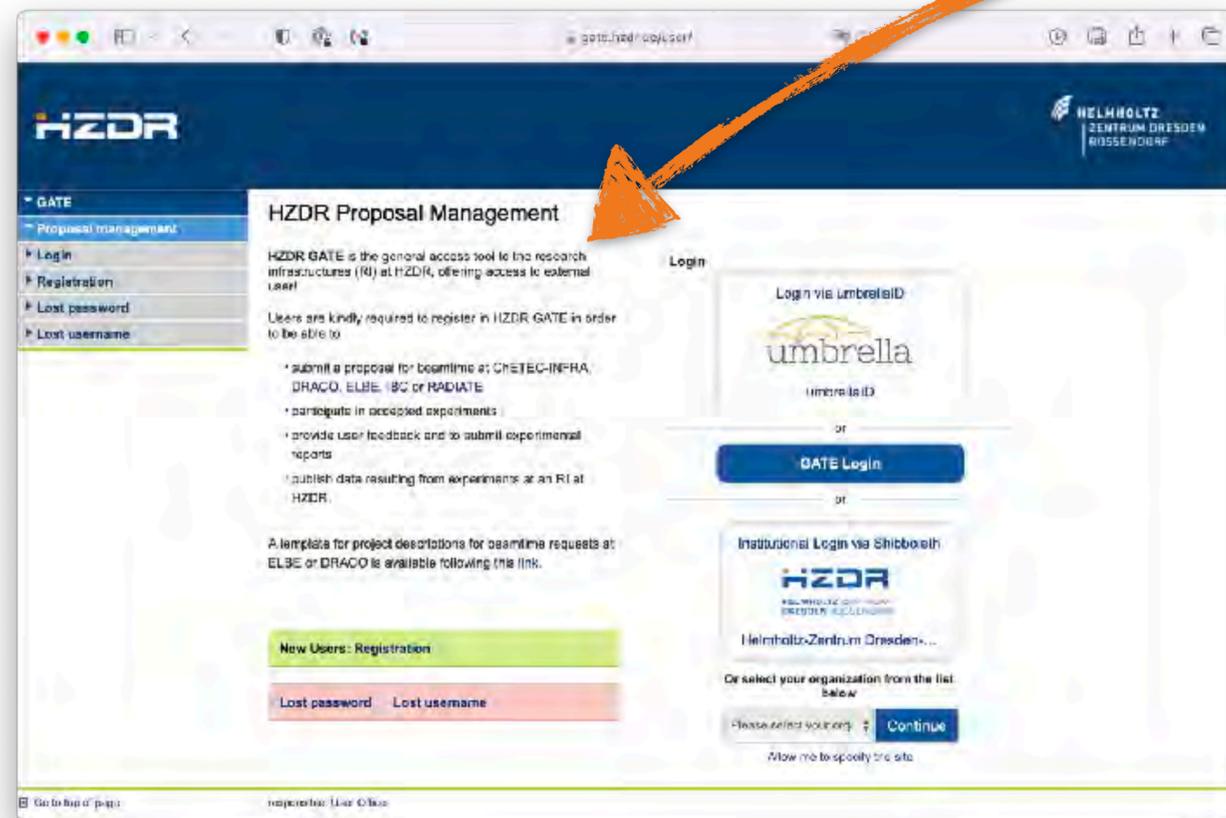

- HELIPORT provides access to our services and guides **external/visiting scientists** through the entire experiment.
- This requires the experiment to be mapped to systems in the HZDR infrastructure.

I. Proposal Submission

Automated transfer of project metadata from the proposal system (GATE) into HELIPOINT:

- Title, Authors, Description,
- Beamtime schedule,
- Large-scale facility used,
- Scientific method (PaNET)

II. Project List and Dashboard

- Typically, a beam line scientist is the owner of a HELIPOINT project and the proposer has the role of the manager and can add additional project members.
- Tags and sub-projects including inheritance are possible in the project list.

The left screenshot shows the 'Project List' page. It features a table with columns for Project Name, Last Modified, and Owner. The table lists several projects, including 'Semantic x-Lab', 'gELBE Projects', and 'Phase-resolved Higgs response in superconducting cuprates'. Each row has an 'Open' button. A 'Create Project' button is at the bottom left.

Project Name	Last Modified	Owner	Action
Semantic x-Lab	Jul 11, 2023	Voigt, Martin (FWCC-D) - 141575	Open
gELBE Projects	Apr 24, 2023	Mueller, Dr. Stefan (FWCC) - 7394	Open
gELBE beamtime 21102205-ST	Sep 11, 2023	Mueller, Dr. Stefan (FWCC) - 7394	Open
gELBE beamtime 21202619-ST	Sep 11, 2023	Mueller, Dr. Stefan (FWCC) - 7394	Open
Example parent project	Apr 24, 2023	Voigt, Martin (FWCC-D) - 141575	Open
ML Ops Project	Jun 06, 2023	Knodel, Dr. Oliver (FWCC) - 132739	Open
SOTA on Uncertainties	May 23, 2023	Pape, David (FWCC) - 139658	Open
Phase-resolved Higgs response in superconducting cuprates	May 23, 2023	Gruber, Thomas (FWCC-D) - 141575	Open
Digital Twin Showcase	Jun 07, 2023	Voigt, Martin (FWCC-D) - 141575	Open
Beamtime Dashboard Test	May 31, 2022	Voigt, Martin (FWCC-D) - 141575	Open
Rodare Data Publication Project	Aug 09, 2022	Knodel, Dr. Oliver (FWCC) - 132739	Open

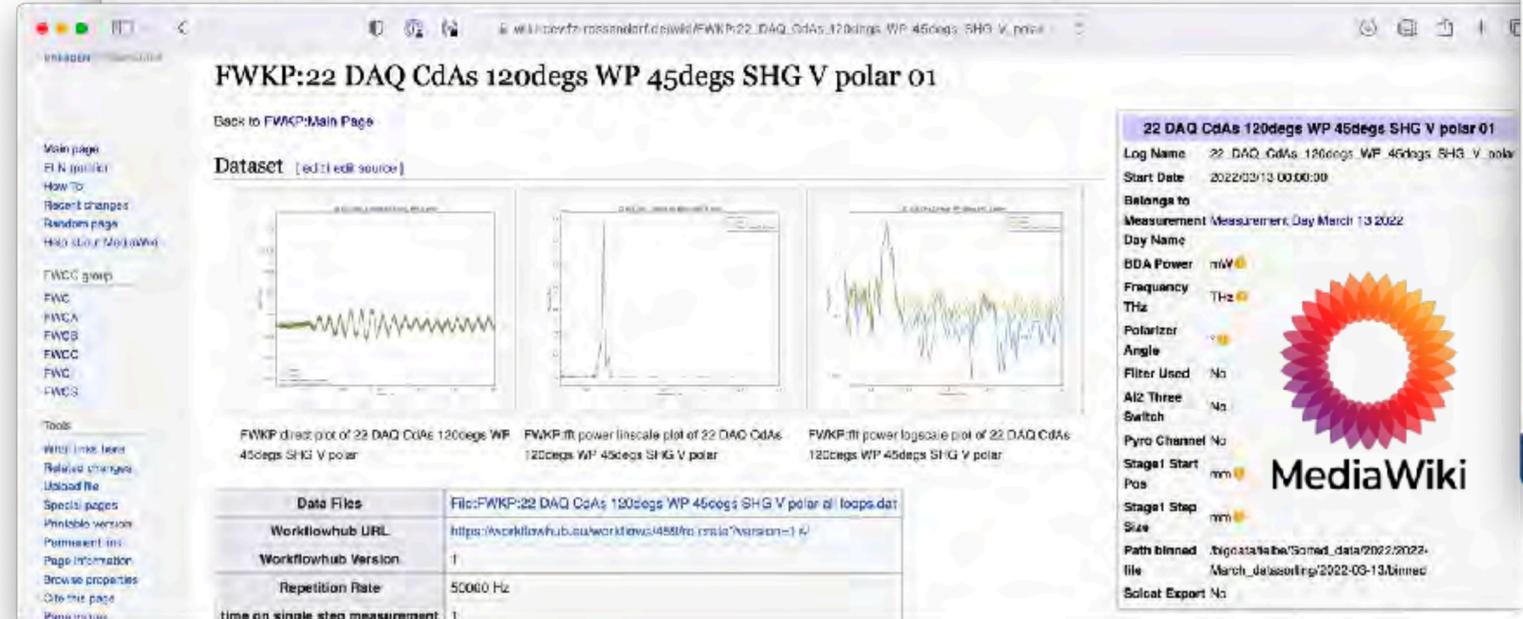

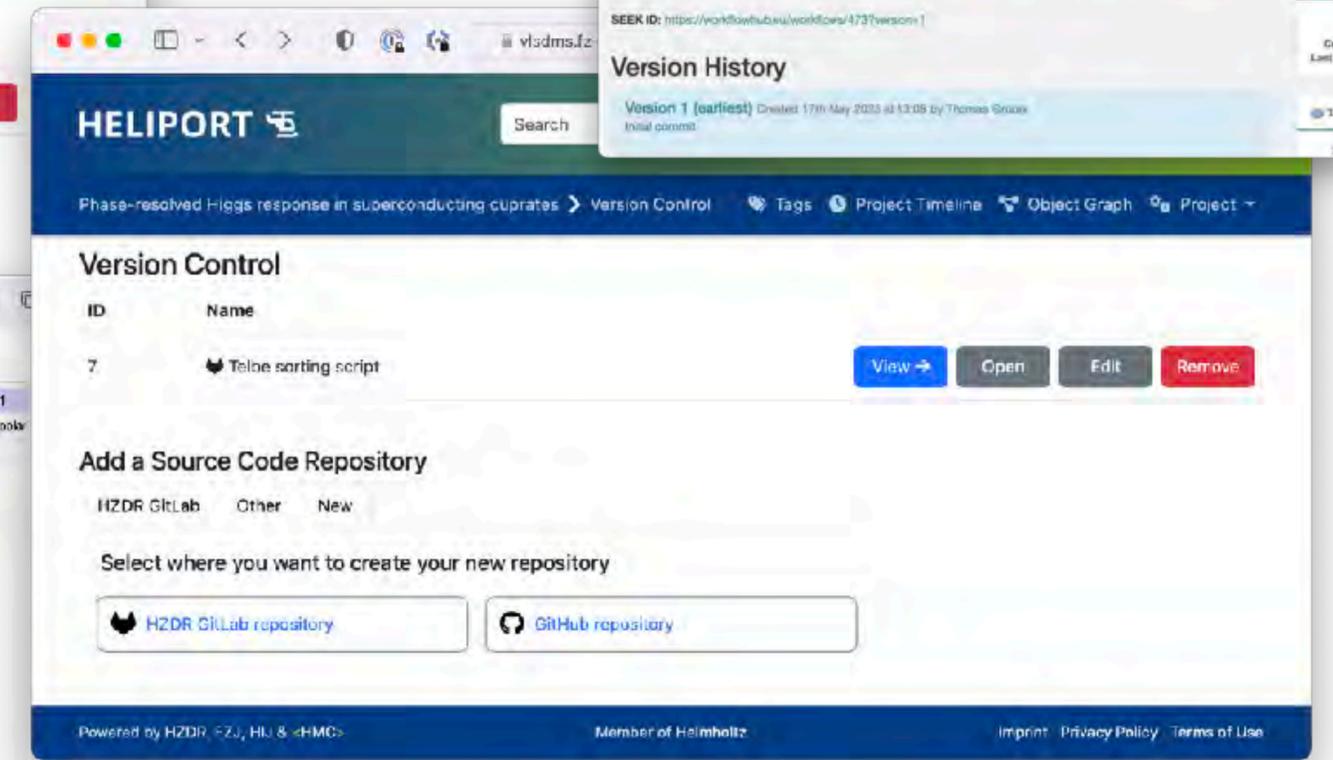

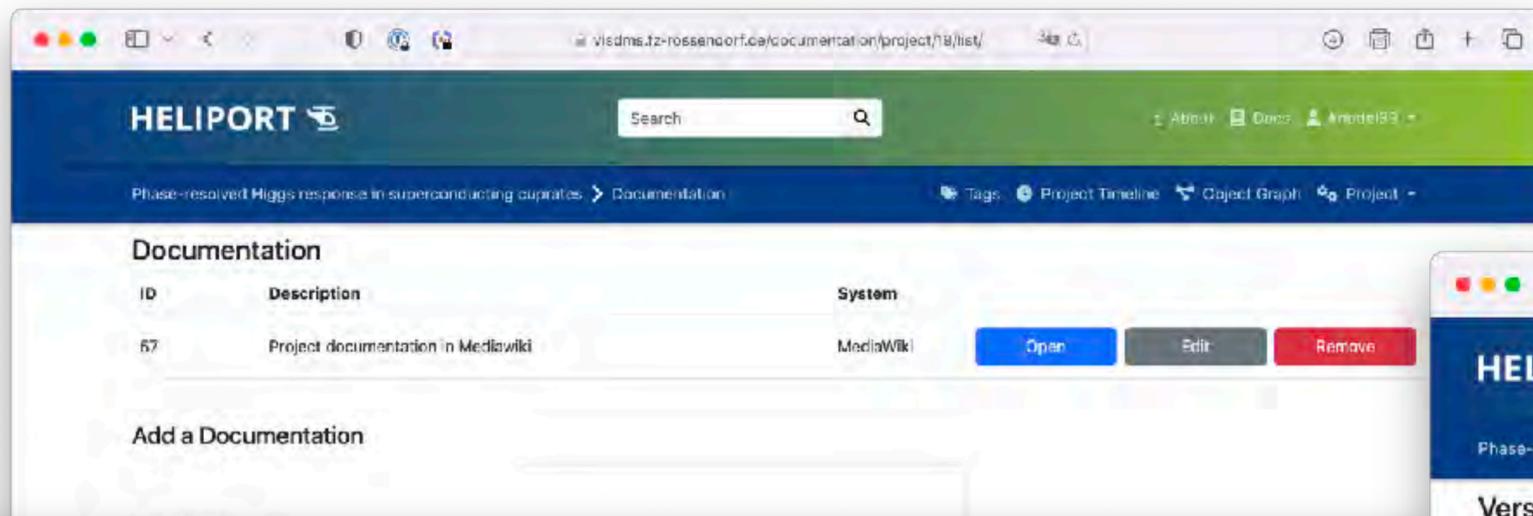

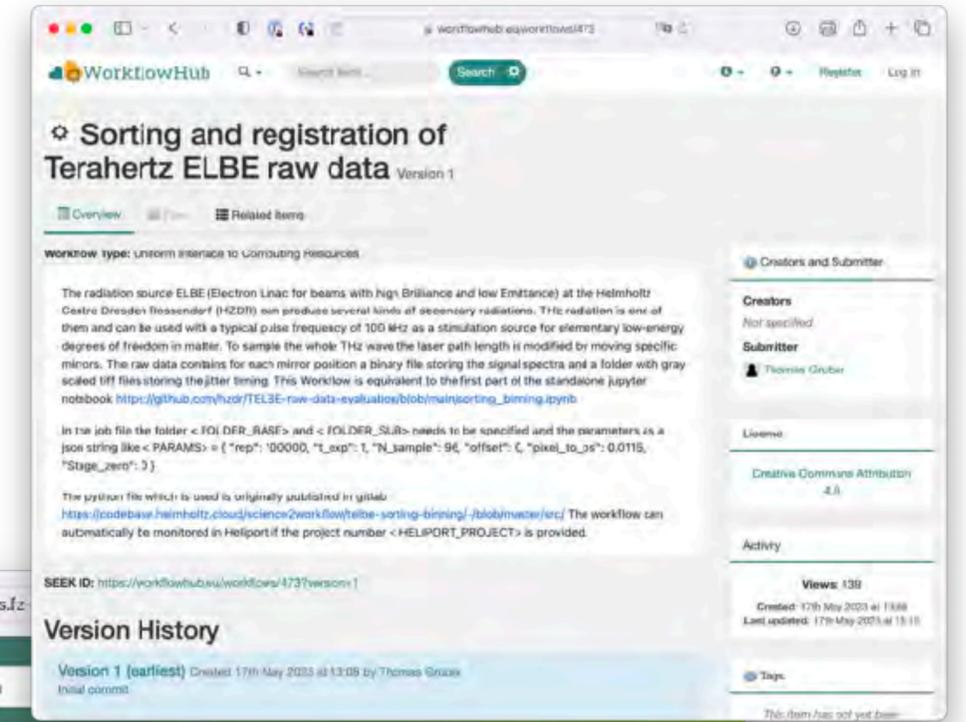

The right screenshot shows the 'Project Dashboard' for the project 'Phase-resolved Higgs response in superconducting cuprates'. It displays a workflow diagram with four main stages: Systems, Resources, Automation, and Results. Each stage contains several components connected by lines and plus signs, indicating a flow or dependency.

- Systems:** Version Control, Data Management Plan, Documentation, Digital Objects
- Resources:** Data Source, SSH Files/Directories, UNICORE Storages
- Automation:** UNICORE Jobs
- Results:** Archive, Publication

III. Resources: Documentation and Repositories

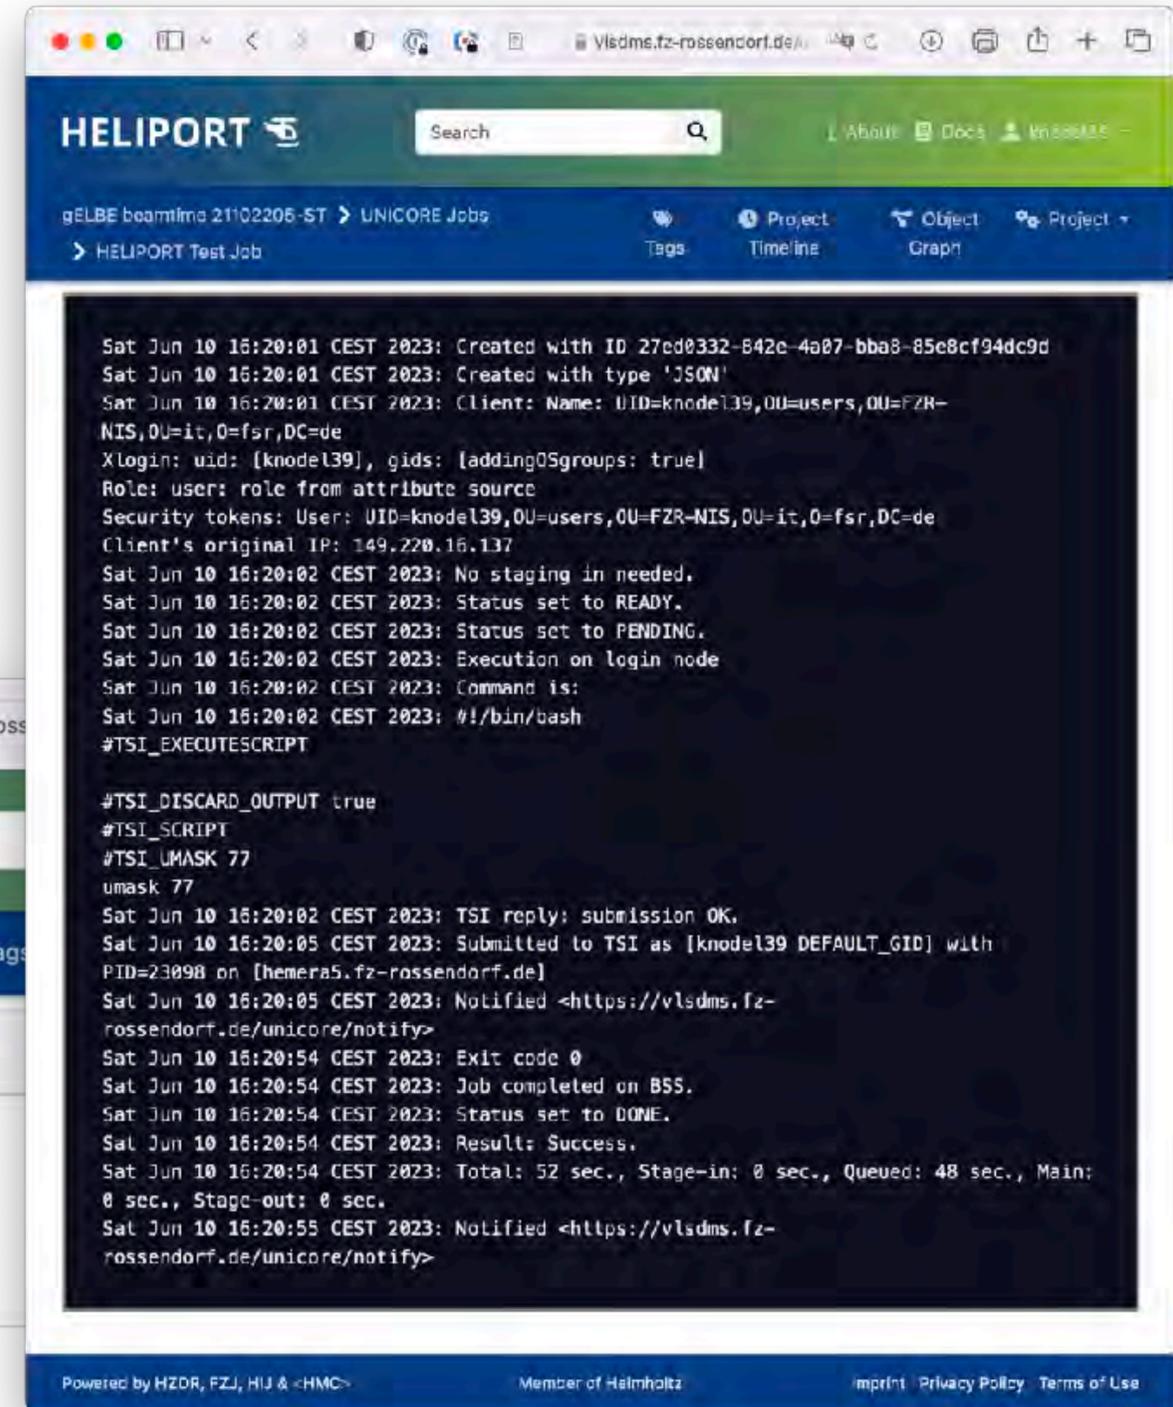

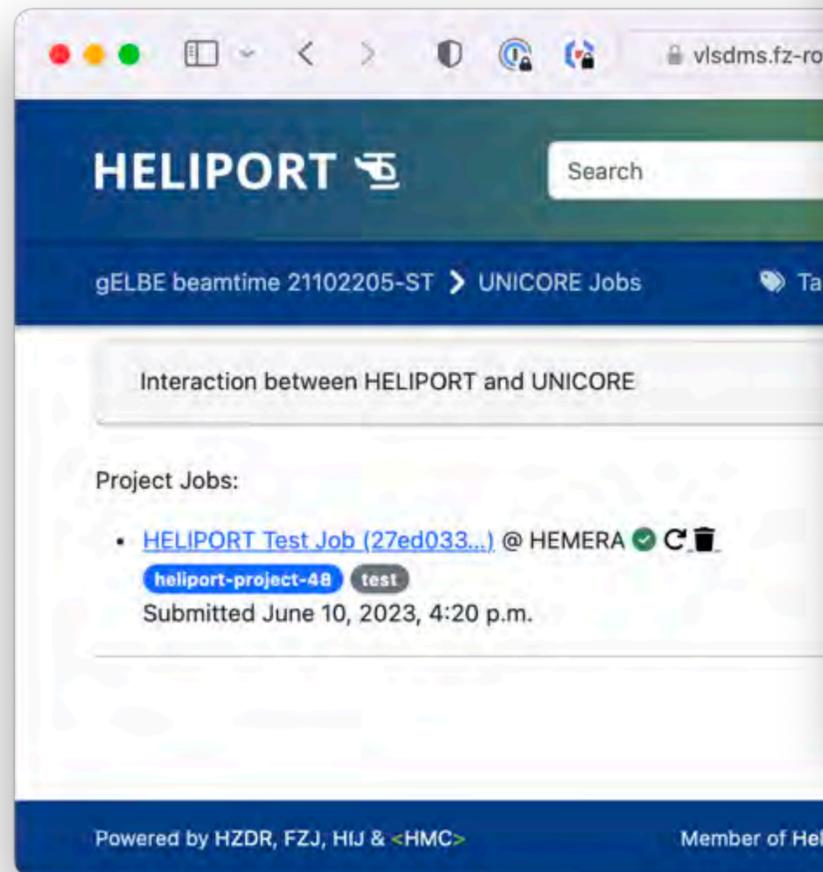

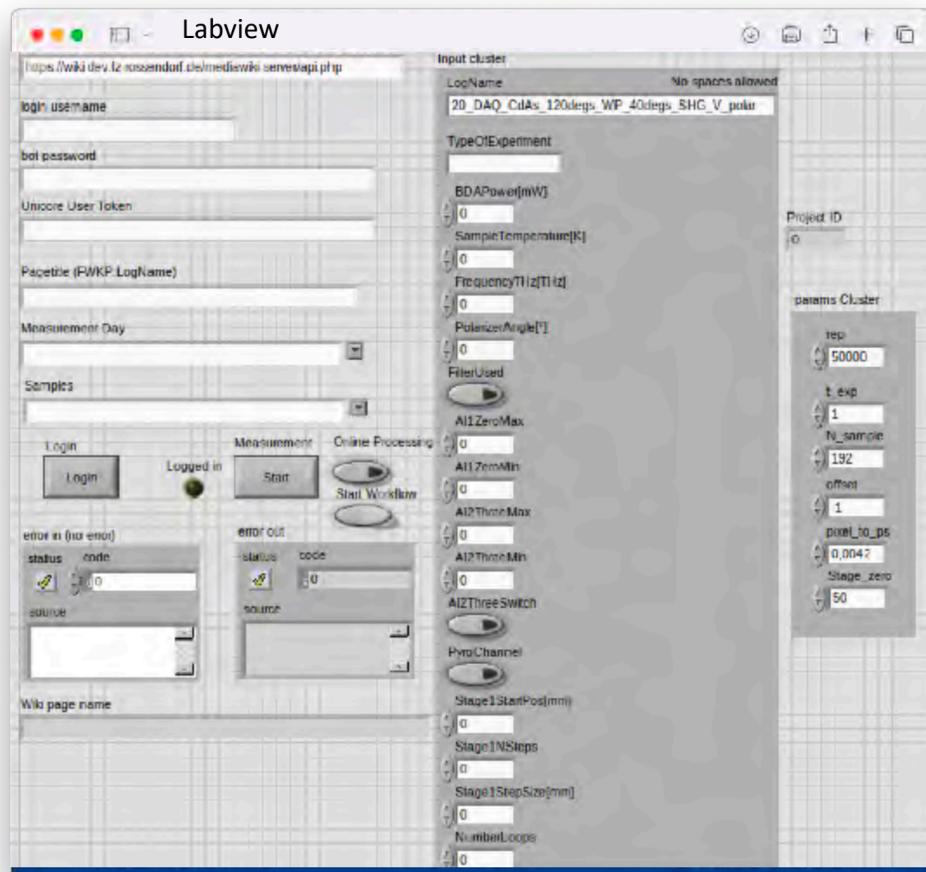

The documentation section is typically used to refer to all internal and external systems or services used:

- E-Labbook (Mediawiki),
- GitLab, Github, Workflowhub, ...

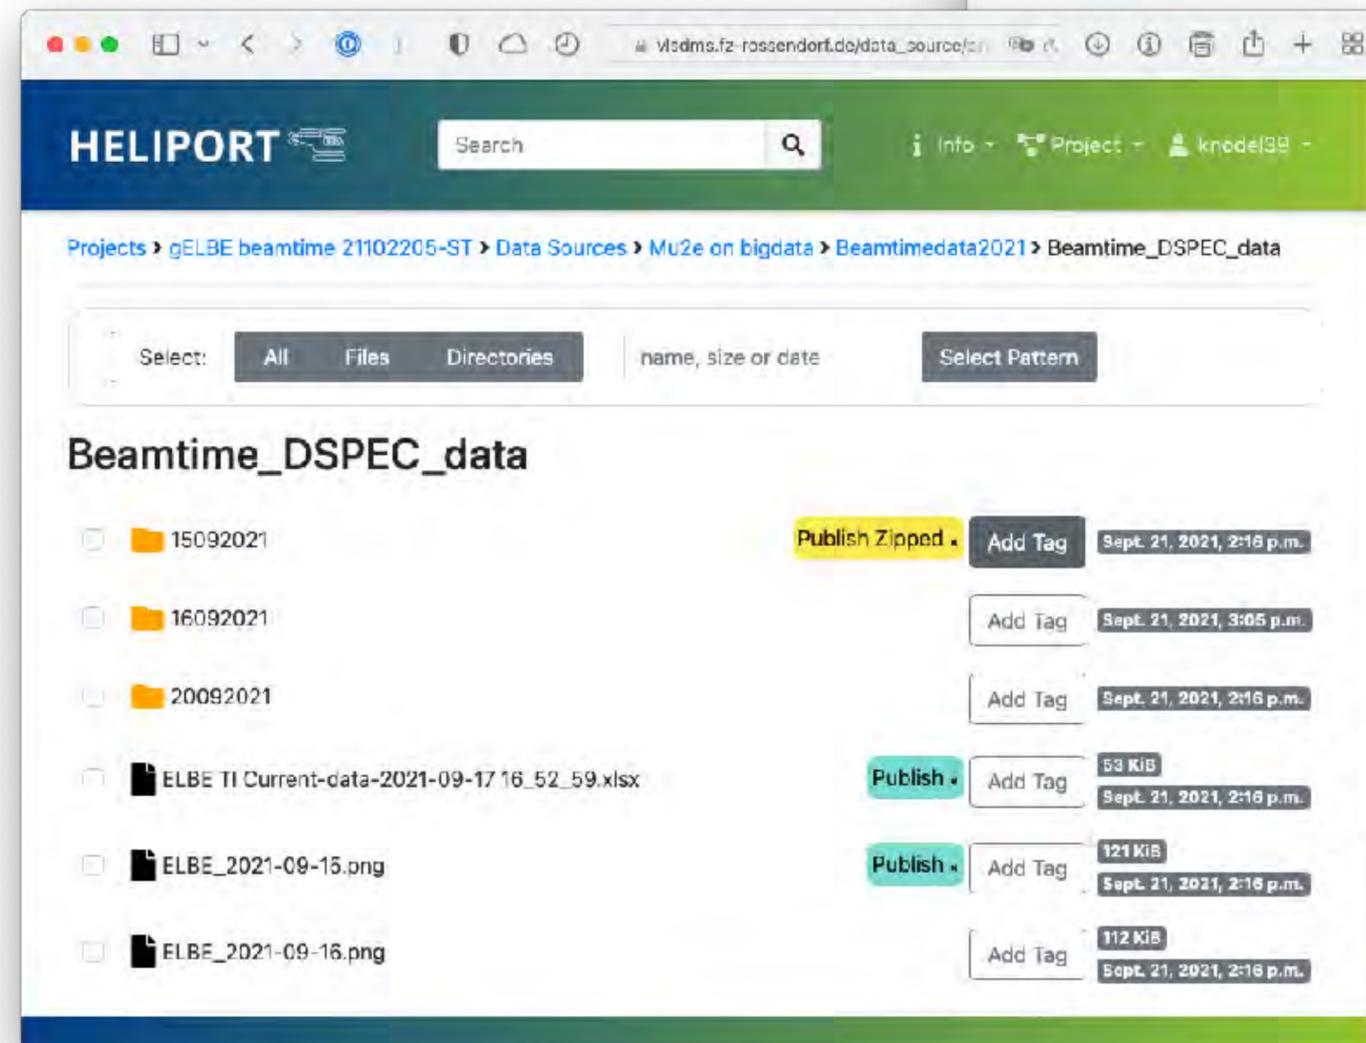

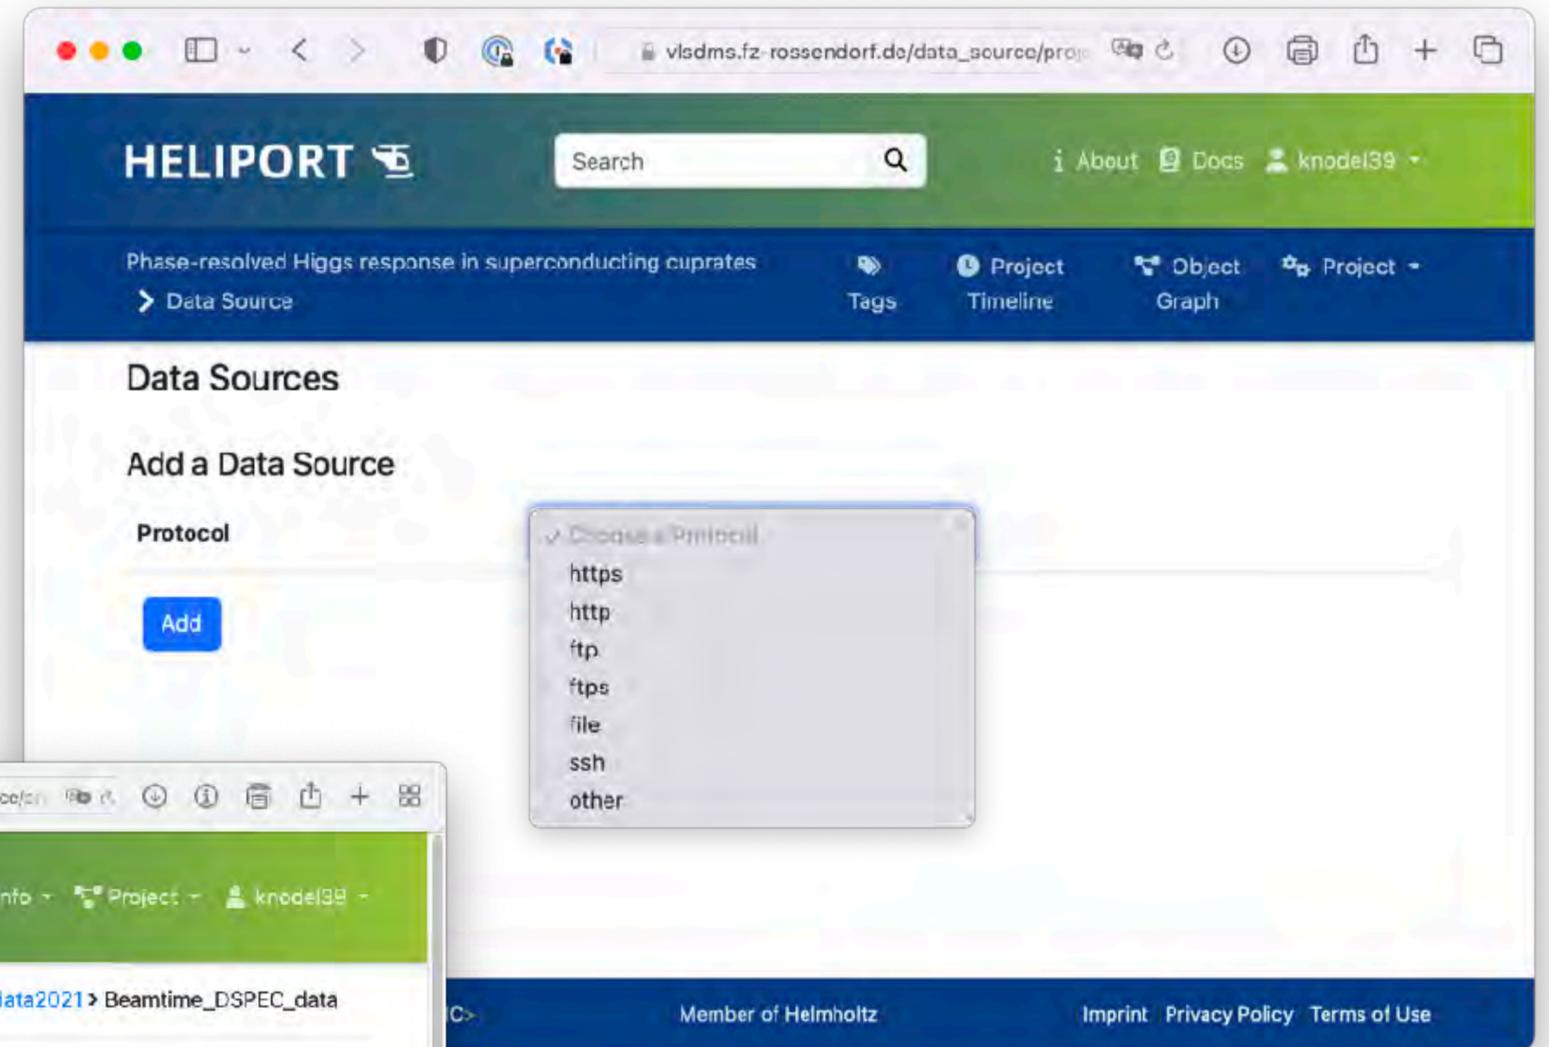

IV. Detector Control and Workflows

- The **HELIPORT REST-API** enables the transfer of metadata between HELIPORT and external systems (e.g. detector control in LabView).
- The integrated job/workflow submission system collects metadata with **provenance information** provided by HELIPORT.
- Workflows (on our HPC cluster) can be accessed by any project member using the HELIPORT web frontend.

V. Data Sources

- Folders and files in our internal filesystems can be registered in HELIPOINT as **data source**.
- Each **project member** has access to the files and folders using HELIPOINT.
- The provenance of the data sets generated from an experiment is entirely comprehensible.

VI. Integration in an Overall Data Publication Workflow

Automated data publication with:

- Metadata from Proposal System,
- Files and folders registered and selected in HELIPOINT.

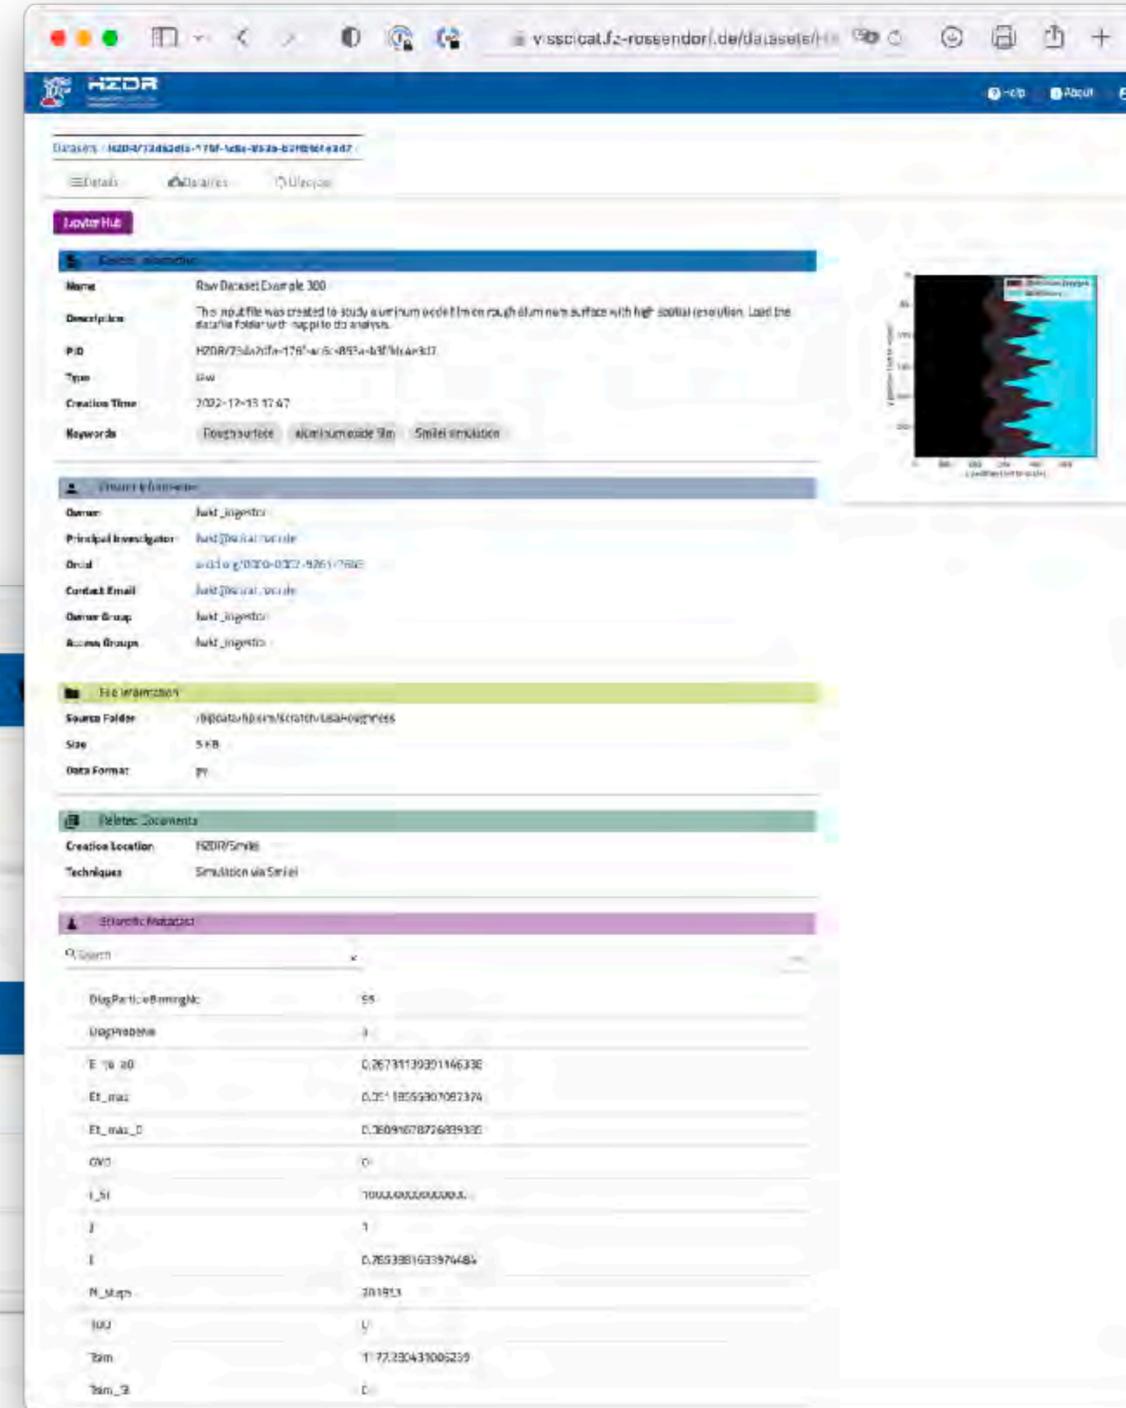

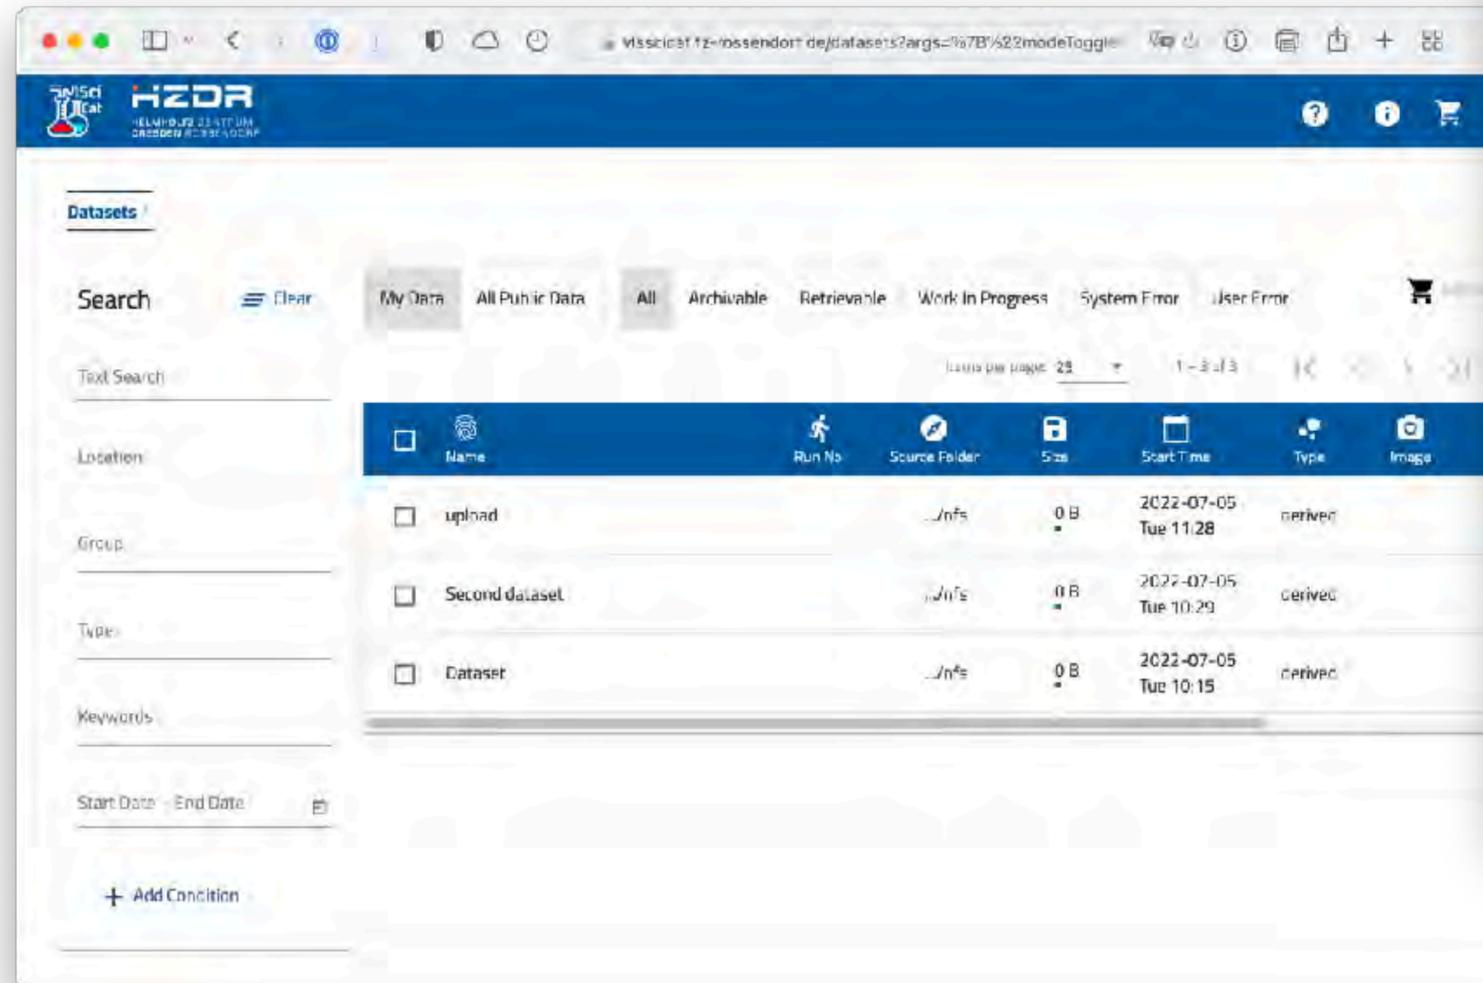

The image illustrates the integration of HELIPOINT and RODARE in a data publication workflow. It features several overlapping screenshots:

- HELIPORT Project Properties:** Shows metadata for a project titled "Phase-resolved Higgs response in superconducting cuprates". Key fields include HZDR-ID (H7DR.FWCC.2021.114636), Digital Object ID (83), and a landing page URL.
- HELIPORT Systems Diagram:** A flowchart showing the integration of "Version Control", "Data Management Plan", and "Documentation" with "Data Source", "SSH Files/Directories", and "UNICORE Storages", which then feed into "Automation" and "UNICORE Jobs".
- HELIPORT File Selection:** A screenshot of the "Second Day" file selection interface, showing a list of files with columns for "name, size or date" and "publication".
- RODARE Dataset Page:** A screenshot of the RODARE website showing a dataset titled "Phase-resolved Higgs response in superconducting cuprates". It displays 2,980 views and 10,619 downloads, along with a list of authors and a detailed description of the experiment.

Orange arrows indicate the flow of information: from the HELIPORT project configuration to the workflow diagram, from the workflow diagram to the file selection interface, and from the file selection interface to the RODARE dataset page.

VII. Search & Reuse: Metadata Catalogue SciCat

- With our data publication repository RODARE we provide a platform for publishing datasets.
- In RODARE, bibliographic metadata is based on **DataCite**.
- For additional **scientific metadata** we use SciCat and reference the specific datasets in RODARE or HELIPORT.

Metadata Catalogue SciCat and Data Repository RODARE (Draft)

Conclusions

- Close and automated interaction of services and systems in our digital research landscape is essential to provide **FAIR** and **comprehensible** research projects.
- HELIPORT describes and **collects metadata** from services and systems involved in experiments.
- APIs and workflows are used to transfer metadata between our services and systems.

HELIPORT HELmholtz Scientific Project WORKflow PlatForm

The guidance system HELIPORT aims to make the entire life cycle of a project at the HZDR findable, accessible, interoperable and reusable according to the FAIR principles, mentioned below. In particular, our data management solution deals with the areas from the generation of the data to the publication of primary research data, the workflows carried out and the actual research results. For this purpose, a concept was developed which shows the various essential components and their connections. Descriptions of the individual components can be found in our HZDR Data Management Strategy.

Intuitive and structured user interface

Project Graph: gELBE beamline 21102205-ST

listProjects
Showing the most general HELIPORT project properties. Request more detailed information by appending url's to the URI. Go to a specific project by appending its id to the url. For more information on how to authenticate look in HELIPORT (user > settings).

1 INTRODUCTION

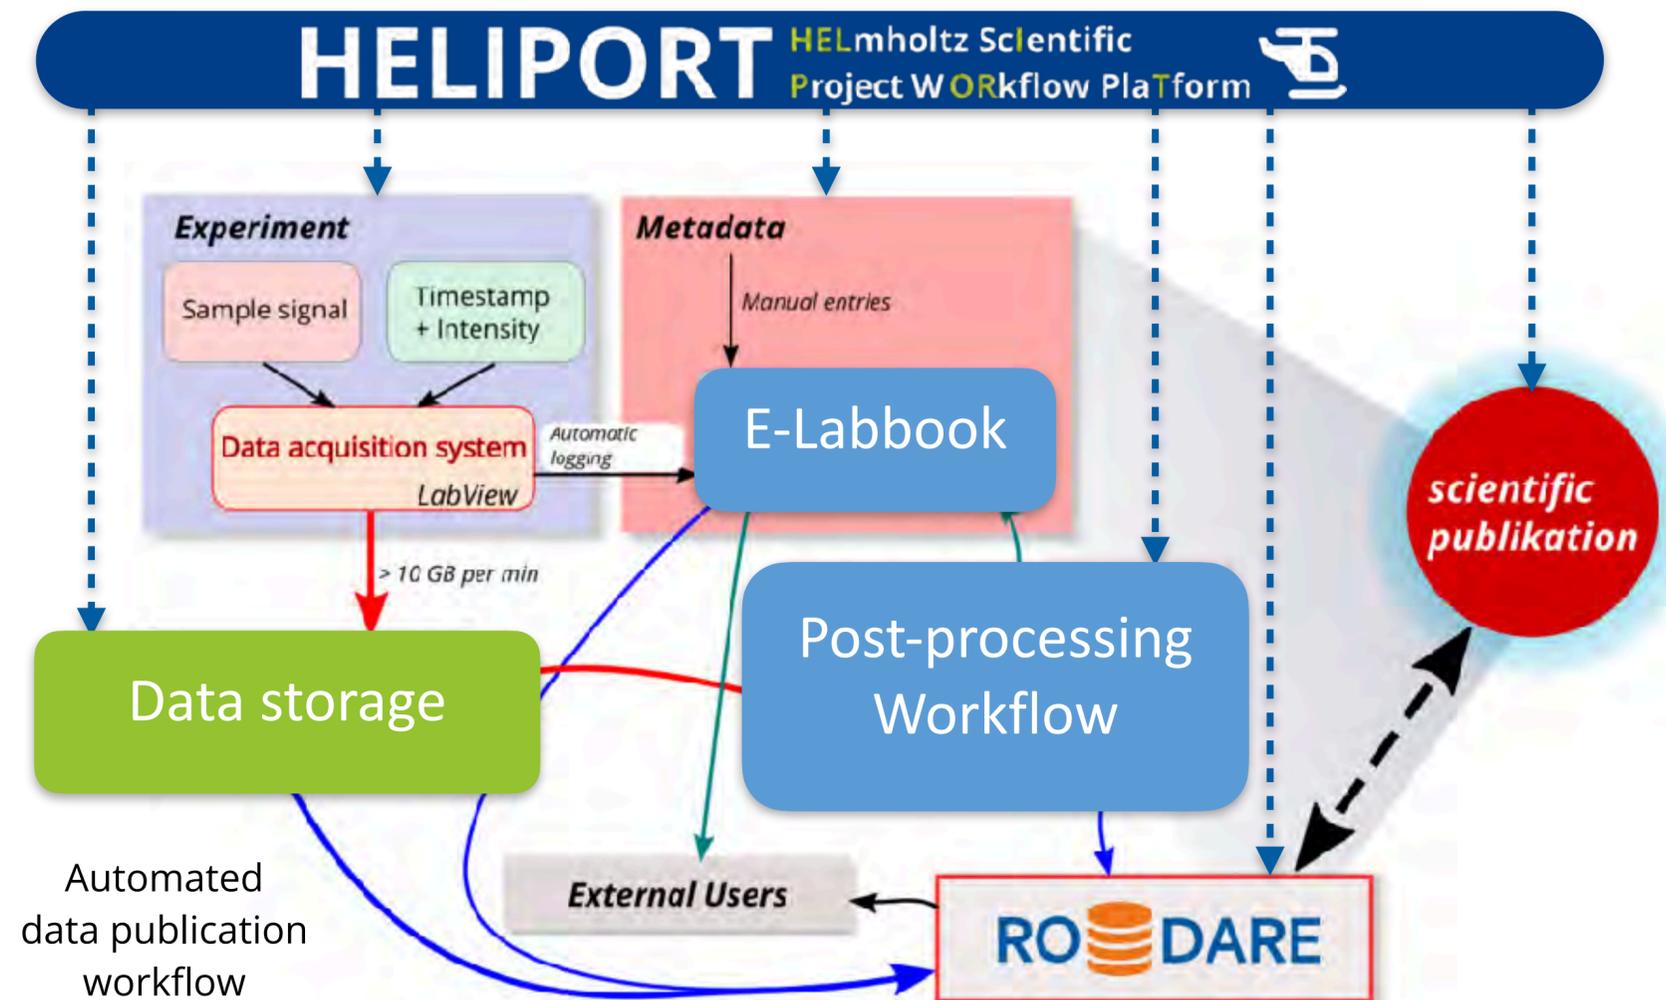

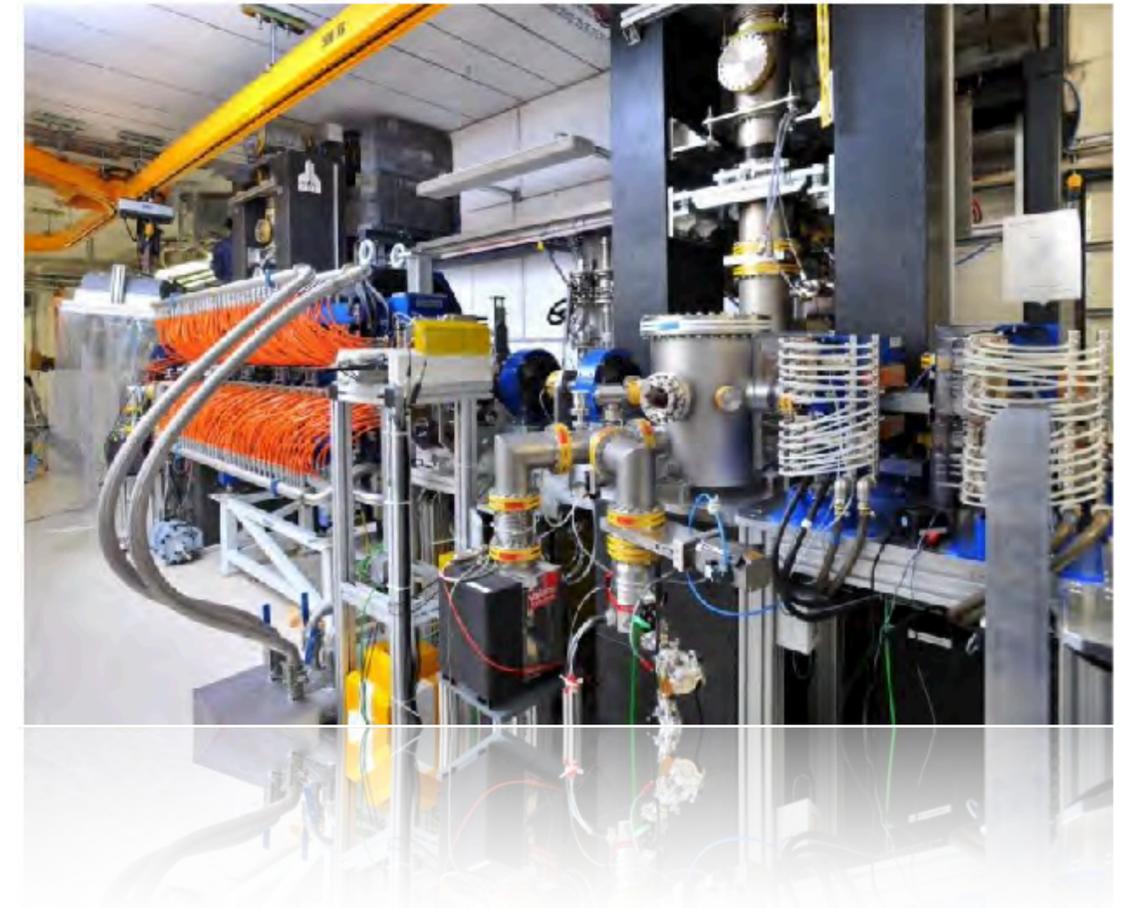

An essential objective of modern cutting-edge research should be to enable accessibility of the acquired research data and its re-usability across different research fields and their respective communities. The current generation of scientists is therefore faced with the challenging task of transferring experimental investigations into a data oriented research flow with strong focus on documenting every step closely following the FAIR [41] principles. The FAIR principles are well-established as standards in the field of research data management. The three pillars F (Findable), A (Accessible) and

Appendix

Example: Data Management View of the TELBE Experiment

- Terahertz facility at the ELBE center for High-Power Radiation Sources.
- In the future HELIPORT guides (external) scientists through the complete experiment.
- Submission of data analysis Jobs from LabView to UNICORE with visualisation in HELIPORT.

Documentation Ecosystem at HZDR

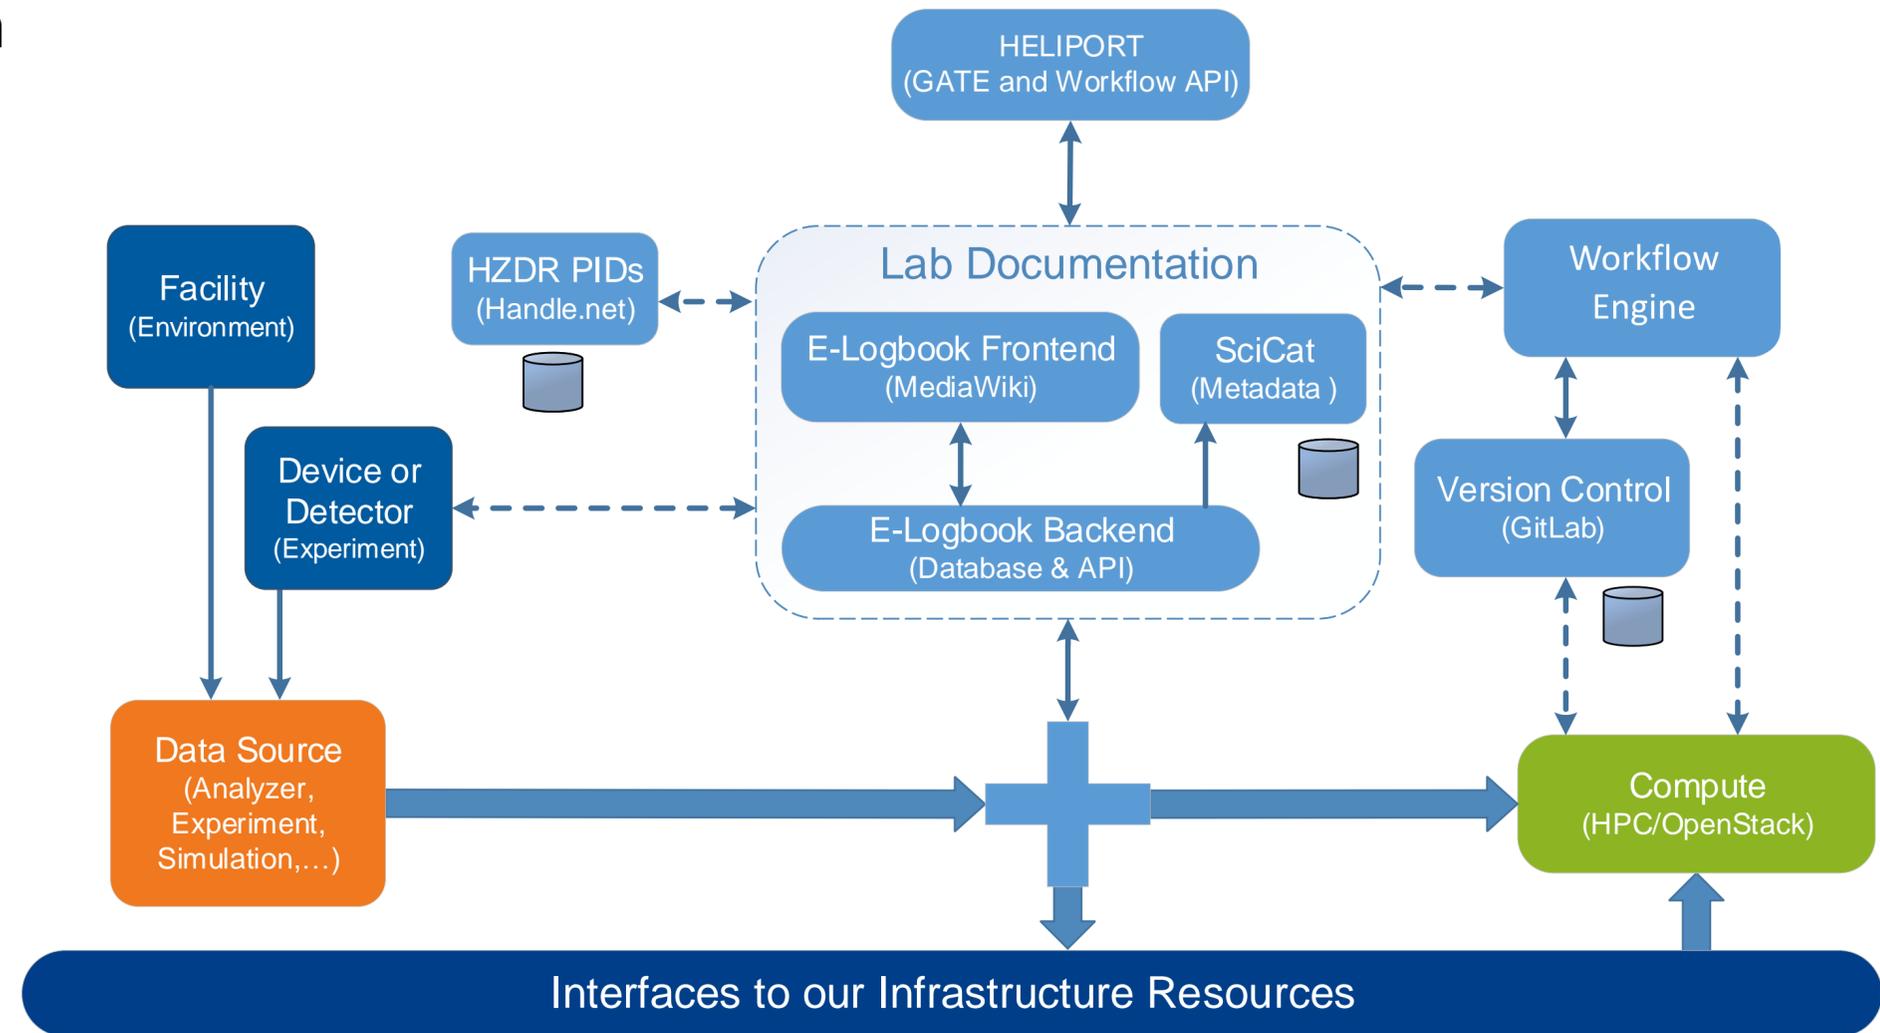

— Our **Electronic Lab Documentation** is a central database gathering information from various systems:

- Proposal management (GATE),
- Environmental data,
- Devices (e.g. Labview),
- Workflows,
- (Meta)data databases.

— Different frontends are available:

- SciCat (metadata only),
- MediaWiki (structured user-definable views).

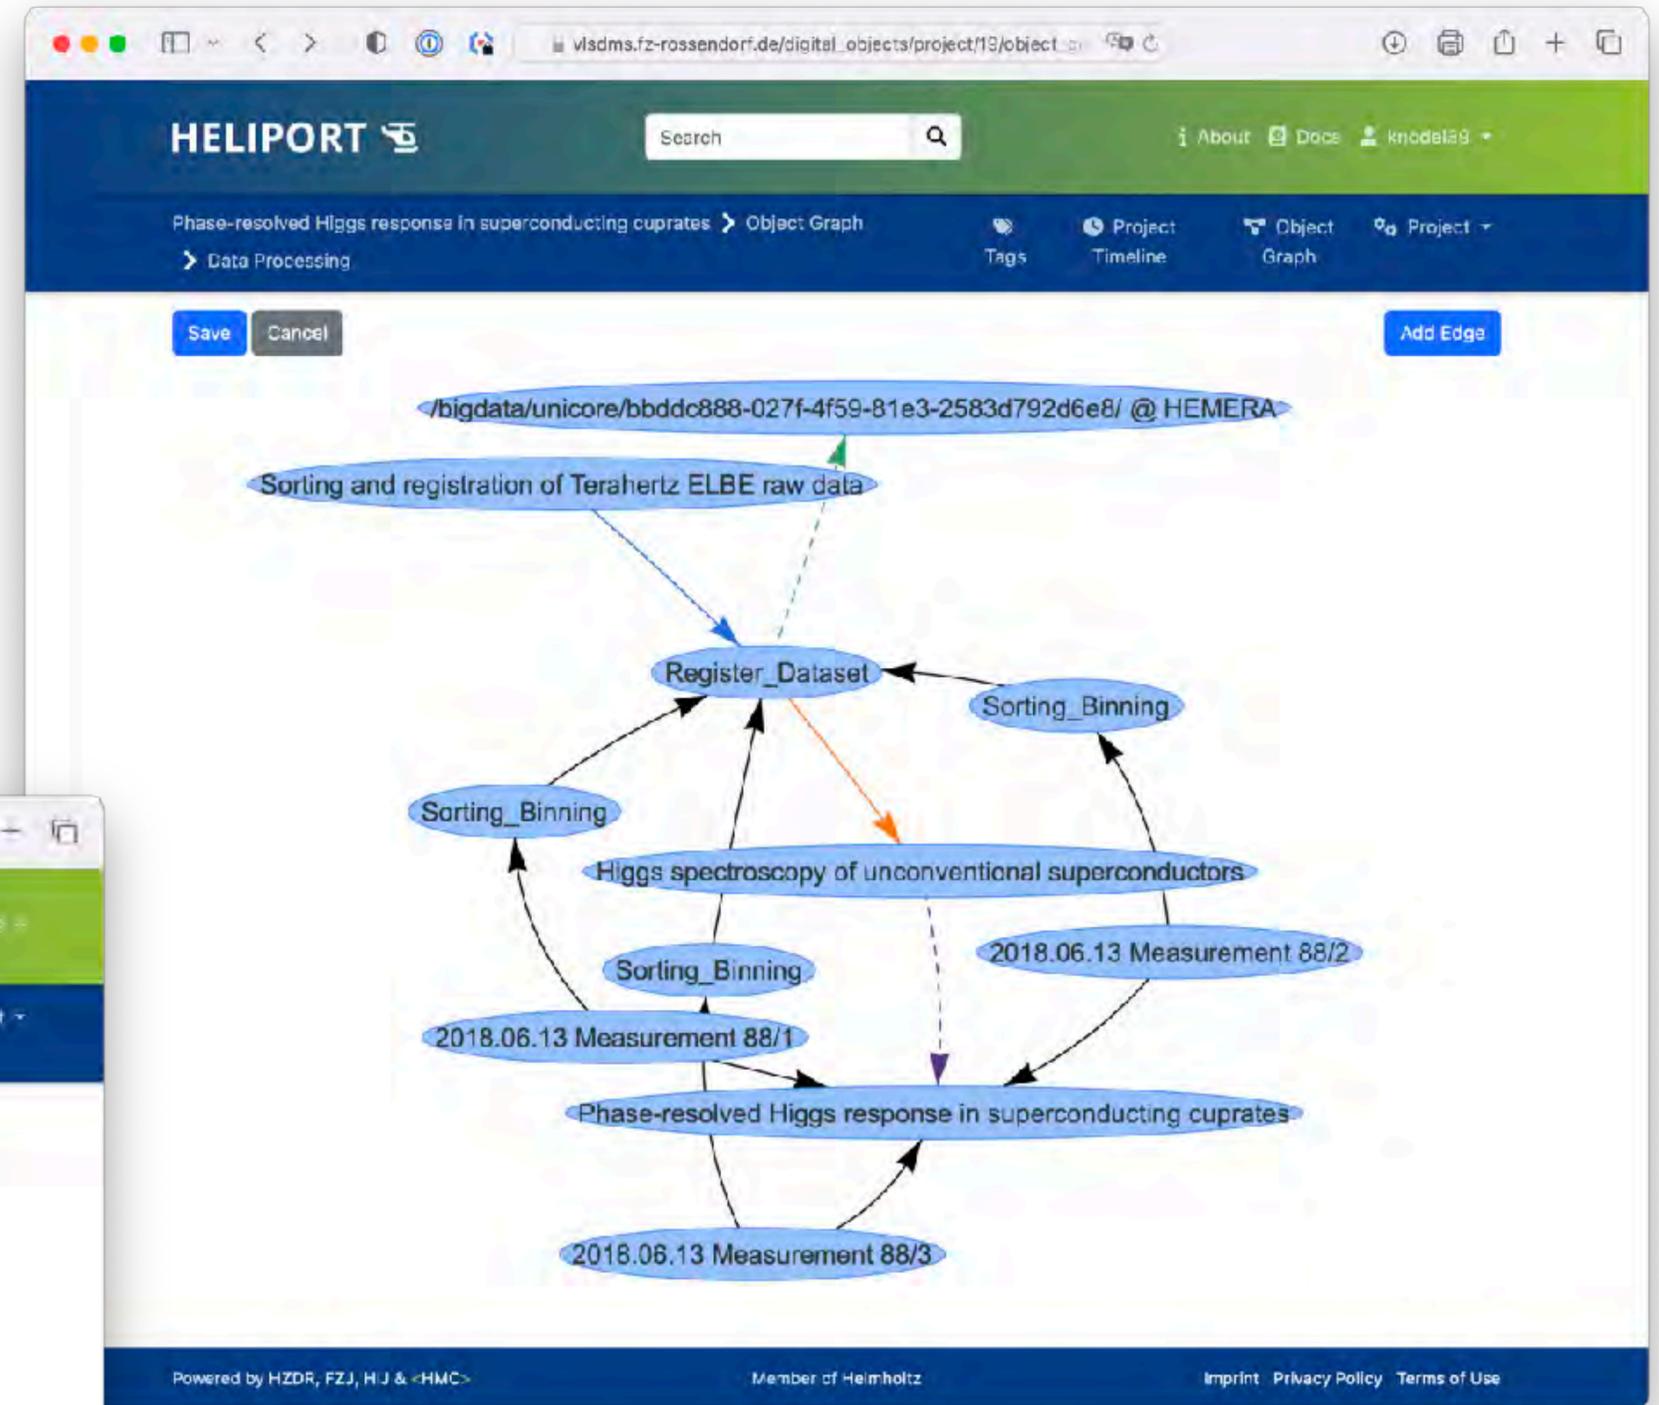

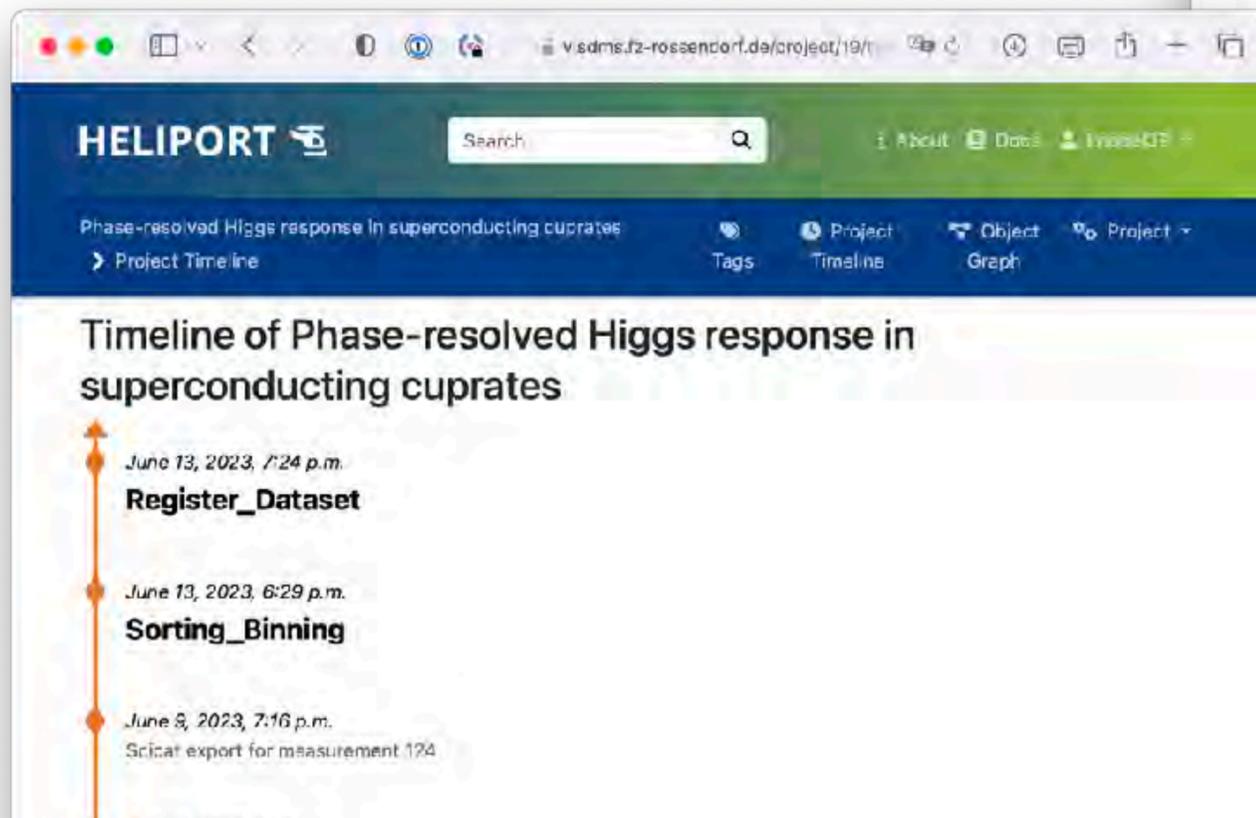

— The system is build on-top:

Cognitive Process Designer

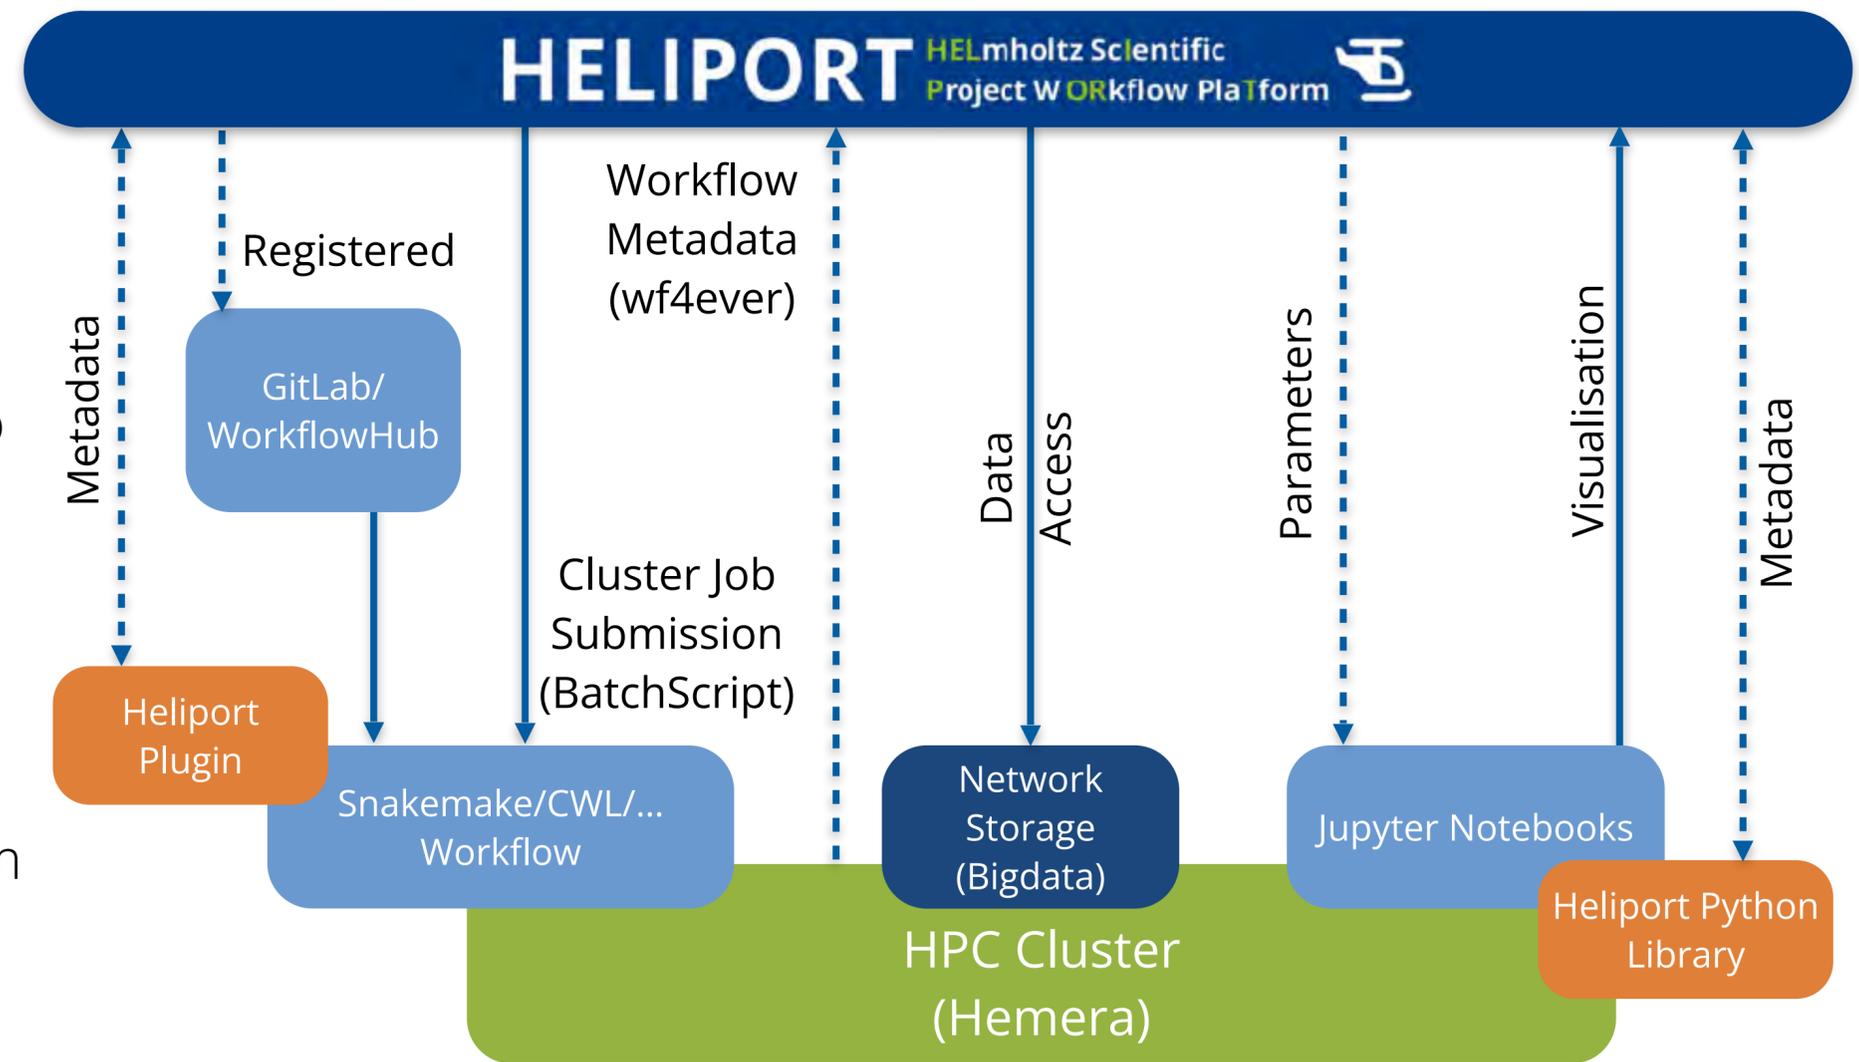

Relations Between Digital Objects and

- Relations between digital objects are visualized to provide a top-level view on the project with dependencies.
- The relationships between simulation (surrogate model) and experiment can also be demonstrated.
- The versioning of an experiment is an essential extension, and first approaches via a timeline are being evaluated.

Workflow Architecture (in development)

- HELIPORT offers an infrastructure which permits the integration of various workflow languages and access modes to HPC infrastructures.
- The infrastructure keeps track of and collects the metadata and enables access to all resources involved.
- Next steps:
 - Python library sending workflow information directly to HELIPORT,
 - Provision of provenance information from Jupyter notebooks,
 - Use case: **PIConGPU**

LabInfrastructure@Geo.X – A Search Portal for Laboratory Infrastructure

Helmholtz Open Science Forum
14th February 2024

Manja Luzi-Helbing, Marc Hanisch, Hannes Fuchs, Hildegard Gödde*

LabInfrastructure@Geo.X – Service for Laboratory Infrastructure Search

- **DataHub** service
(*Laboratory Infrastructure Inventory LI2*)
- Joint and comprehensive laboratory infrastructure portfolio
- Role-based curation of information about laboratories, instruments, methods and more
→ information available via search portal
- Concept is compatible with multiple institutional or network environments within Helmholtz and beyond
- Customized to the needs of the Geo.X network as **LabInfrastructure@Geo.X**

<https://datahub.erde-und-umwelt.de/en/tools-and-services>

Geo.X Research Network for Geosciences in Berlin and Potsdam

➤ Search portal for the laboratory infrastructure within the network: LabInfrastructure@Geo.X

LabInfrastructure@Geo.X - A Laboratory Infrastructure Search Portal for the Geo.X Network

- Participation of all nine Geo.X partner institutions
- Currently ca. 220 entries for laboratories, further inquiries in progress
- Tagging from over 250 analytical methods / instruments
- First start in May 2020, relaunch as DataHub service in July 2023

The screenshot shows the homepage of the LabInfrastructure@Geo.X search portal. At the top, the title "LabInfrastructure @ Geo.X" and subtitle "Geo.X Laboratory Infrastructure Search" are displayed. Below this is a "Welcome to the laboratory infrastructure portal: LabInfrastructure@Geo.X" section with a brief description of the portal's purpose. A search bar with a "Search" button and a link to "Advanced Search" is located in the middle. At the bottom, there is a section titled "Please click the institutional logos to search for the respective laboratory infrastructure" with a grid of logos for various institutions including GFZ, TU, and DLR.

<https://www.geo-x.net/geox-laboratory-infrastructure-search/>

LabInfrastructure@Geo.X – Laboratory Search

The screenshot displays the 'Laboratory Search' interface. On the left, a 'Search Filter' sidebar is visible, containing a tree view of categories: Institutes (listing various research centers like Alfred Wegener Institute, DLR, etc.), Analytical Methods (listing techniques like Acid Digestion, etc.), and Instruments (listing equipment like Abrasion Mills, etc.). The main search results area shows a search bar at the top with the text '218 laboratories found (0,454 s)'. Below the search bar, two laboratory entries are displayed. The first entry is '(U-Th-Sm)/He Laboratory' from the University of Potsdam, featuring a description of the lab's capabilities and a small image. The second entry is '3D Visualization Laboratory - Geosciences' also from the University of Potsdam, with a description and a small image. At the bottom of the page, there is a footer with navigation links (ABOUT, HELP, IMPRINT, etc.) and a '© 2023' copyright notice.

<https://labinfrastructure.geo-x.net/laboratories/>

Semantic search options and extended filter functions

- Filter by institutes, instruments, methods etc.
- Search for keywords
- Use search operators to combine or exclude keywords

LabInfrastructure@Geo.X – Laboratory Details and Change Request

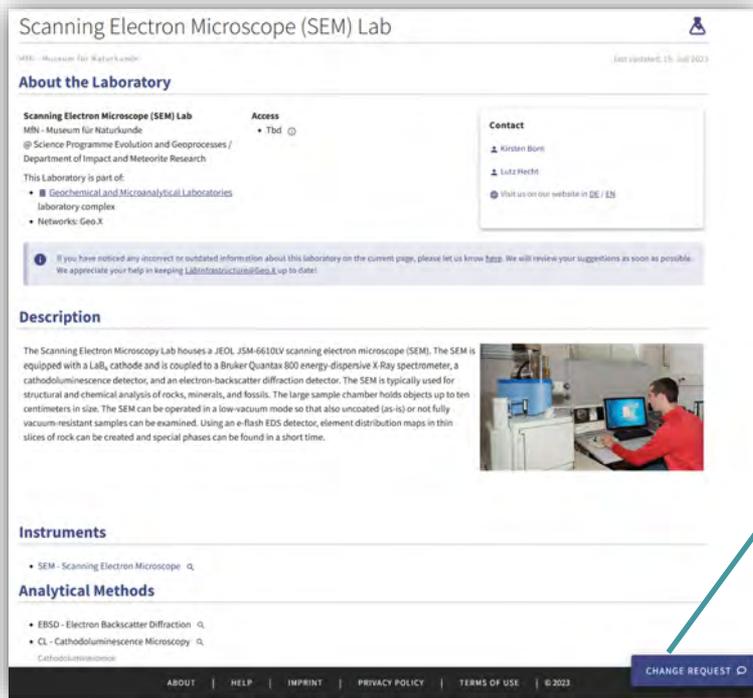

The screenshot shows the 'Scanning Electron Microscope (SEM) Lab' page. The header includes the title and a user profile icon. Below the header, there is a navigation bar with 'About the Laboratory' selected. The main content area is divided into several sections: 'About the Laboratory' (including 'Scanning Electron Microscope (SEM) Lab' and 'Access'), 'Description' (with a photo of a person at a computer), 'Instruments', and 'Analytical Methods'. A 'CHANGE REQUEST' button is visible at the bottom right of the page.

<https://labinfrastructure.geo-x.net/laboratories/105>

Lab Detail Page

- Brief description of the laboratory
- Instrument and analytical method (using a defined vocabulary)
- Contact details of laboratory supervisor(s)
- Laboratory location (institution)
- Link to original laboratory websites
- Key and data publications
- Information on user access to laboratories and user regulations if available

LabInfrastructure@Geo.X – Laboratory Details and Change Request

Scanning Electron Microscope (SEM) Lab

MIN - Museum für Naturkunde
@ Science Programme Evolution and Geoprocesses / Department of Impact and Meteorite Research

This Laboratory is part of:

- Geochemical and Microanalytical Laboratories laboratory complex
- Networks: Geo.X

Description

The Scanning Electron Microscopy Lab houses a JEOL JSM-6610LV scanning electron microscope (SEM). The SEM is equipped with a LaB₆ cathode and is coupled to a Bruker Quantax 800 energy-dispersive X-Ray spectrometer, a cathodoluminescence detector, and an electron-backscatter diffraction detector. The SEM is typically used for structural and chemical analysis of rocks, minerals, and fossils. The large sample chamber holds objects up to ten centimeters in size. The SEM can be operated in a low-vacuum mode so that also uncoated (air-is) or not fully vacuum-resistant samples can be examined. Using an e-flash ED5 detector, element distribution maps in thin slices of rock can be created and special phases can be found in a short time.

Instruments

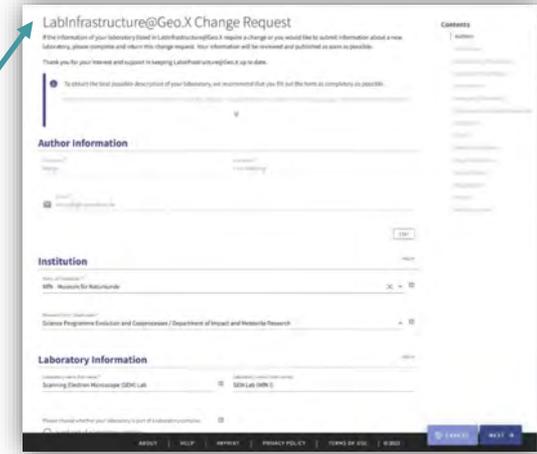

- SEM - Scanning Electron Microscope

Analytical Methods

- EBSD - Electron Backscatter Diffraction
- CL - Cathodoluminescence Microscopy

CHANGE REQUEST

<https://labinfrastructure.geo-x.net/laboratories/105>

LabInfrastructure@Geo.X Change Request

If the information of your laboratory listed in LabInfrastructure@Geo.X requires a change or you would like to submit information about a new laboratory, please contact us and submit a change request. Your information will be reviewed and published as soon as possible.

Thank you for your interest and support in keeping LabInfrastructure@Geo.X up to date.

To obtain the best possible description of your laboratory, we recommend that you fill out the form as completely as possible.

Author information

Institution

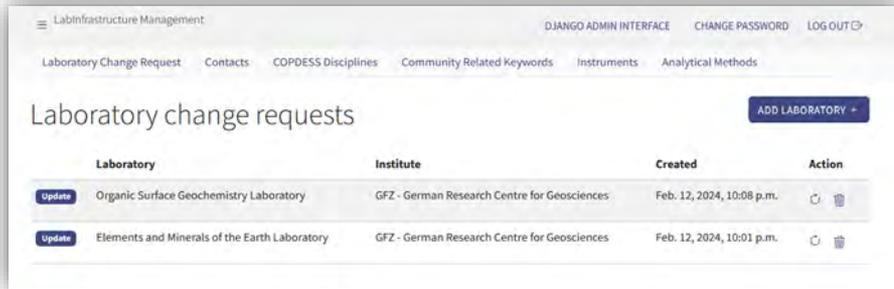

Laboratory information

SUBMIT

Web-based user interface to submit new and modified records

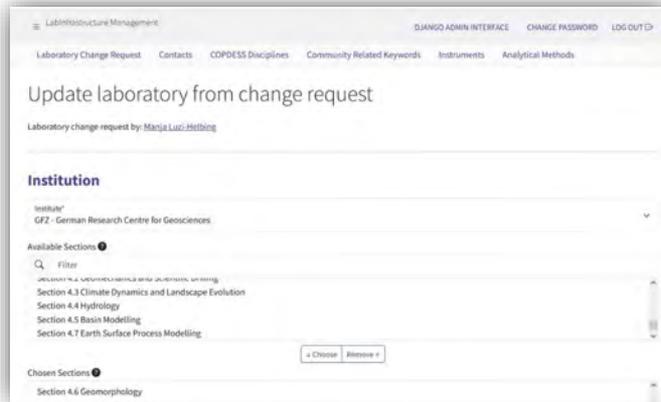

- User-friendly form for change requests
- Searchable vocabulary
- Integrated help system

LabInfrastructure@Geo.X – Management Interface for Curation

Decentral editing and curation of laboratory's metadata

- Feature-rich editor for curators
- Review of the change request with existing metadata
- Approval process

LabInfrastructure@Geo.X – Vocabulary

Advanced vocabulary for instruments and analytical methods aligned with international standards

- Based on the NASA GCMD instrument keywords
- Easy to update, customize and expand
- Browseable by categories

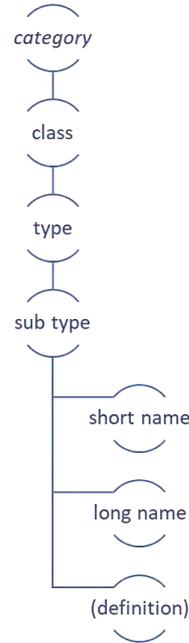

INTERNATIONAL UNION OF
PURE AND APPLIED CHEMISTRY

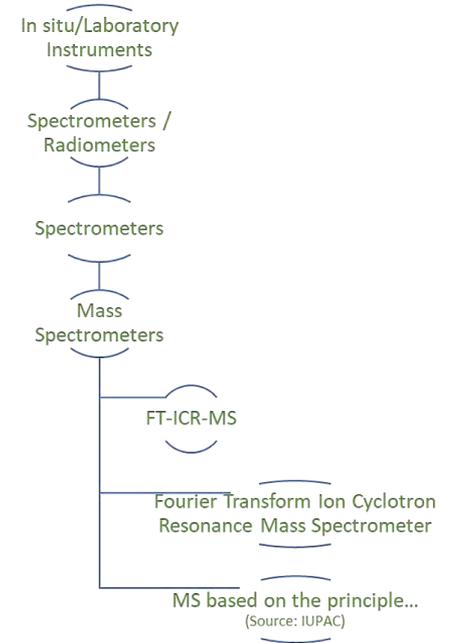

Geo.X
vocabulary

LabInfrastructure@Geo.X – Vocabulary

- **Four-level keyword structure** for the Geo.X keywords as well as a short name/long name + definition for the instruments and analytical methods
- Adapted from NASA GCMD instrument / sensor keyword structure
- Choice between **Geo.X vocabulary** and **NASA GCMD instrument keywords**

NASA instrument / sensor keyword structure

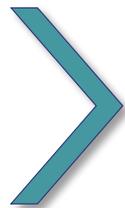

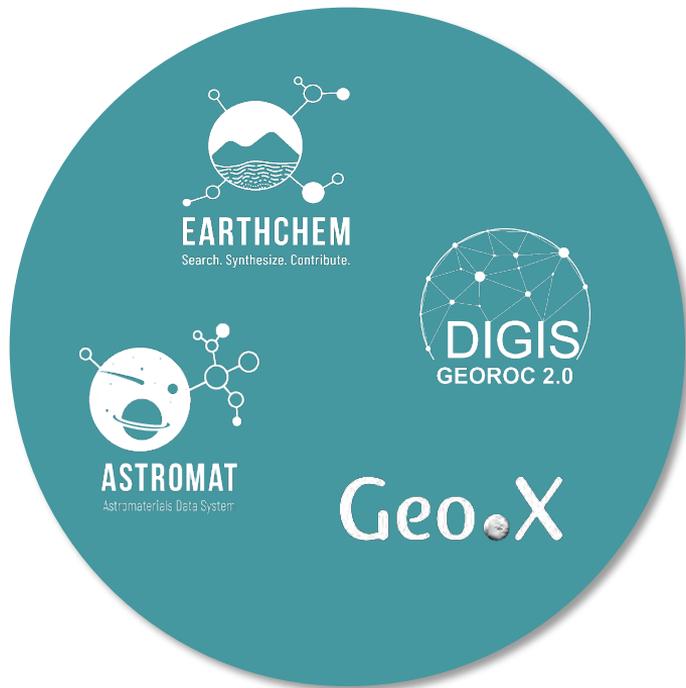

Adapted hierarchical structure based on an example for Geo.X instrument keyword

The Open Infrastructure Portal for DESY and HIFIS

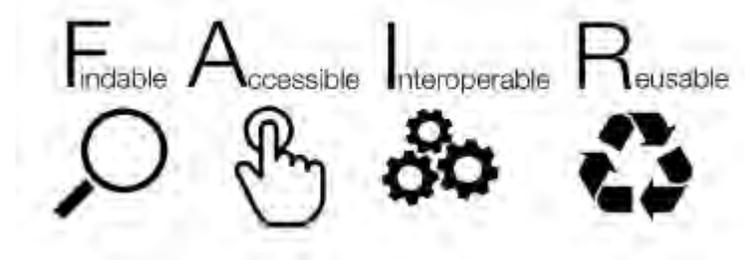

Tim Wetzel & Patrick Fuhrmann
Hamburg, 14.04.2024

Open and FAIR data for Photon Science in DESY

The motivation for a prototype system

FAIR data will become the standard

- Funding bodies and journals demand data to be open and/or FAIR
 - Public money = public data (after embargo period)
 - Supplemental data for publications
- Combatting the reproducibility crisis in science
- Reusability makes for a more sustainable (re-)use of results obtained from costly and laborious experiments

Starting with Photon Science

- As one of the largest photon science laboratories in Europe, DESY will start providing a standardized way to host Open and FAIR data for her scientists

Why FAIR?

- Not only for verifiable & reproducible scientific results (as enforced by many journals)
- Machine readability for e.g. ML & AI

The minimum viable system for DESY.

Essential components with federated access (authenticated & non-authenticated)

Long term storage (dCache via hifis-storage.desy.de)

- accessible via **standard protocols** (https, NFS, WebDAV)

1st phase

Metadata Catalogue with

- mandatory **core metadata** fields
- optional **domain specific metadata** fields
- **OAI-MPH protocol** for data harvesting of core metadata by high level catalogues

2nd phase

DOI Minting Service

- In cooperation with our library

Open Science (Virtual Research) infrastructure

- **VISA** portal, currently working on it together with other synchrotron facilities in Europe under an MoU

How we interpret Open and FAIR data

Open data by itself is of no value unless it fulfills certain quality criteria

- Since 2014 these criteria are known as [FAIR data principles](#)
- [FAIR](#) \neq [Open](#): FAIR just defines attributes and level of reusability, openness is not a requirement
 - Providing access can be a matter of resources, licenses, embargo times, ...
- One of 1000s of definitions for FAIR: [Cambridge Crystallographic Data Center](#)
 - “The FAIR Data Principles set out criteria that enable the philosophy of openness to be realized in a tangible way through modern publishing practices and infrastructures that support current data science needs.”
- Open data enriched by metadata, context and provenance allows for better understanding and makes it more valuable

Importance of proper metadata definitions

Consensus and standards are key

Mandatory **core metadata fields**

- Defined in prior activities and by responsible reference bodies
 - e.g. Dublin Core, DataCite v4.4

Optional **domain specific metadata fields**

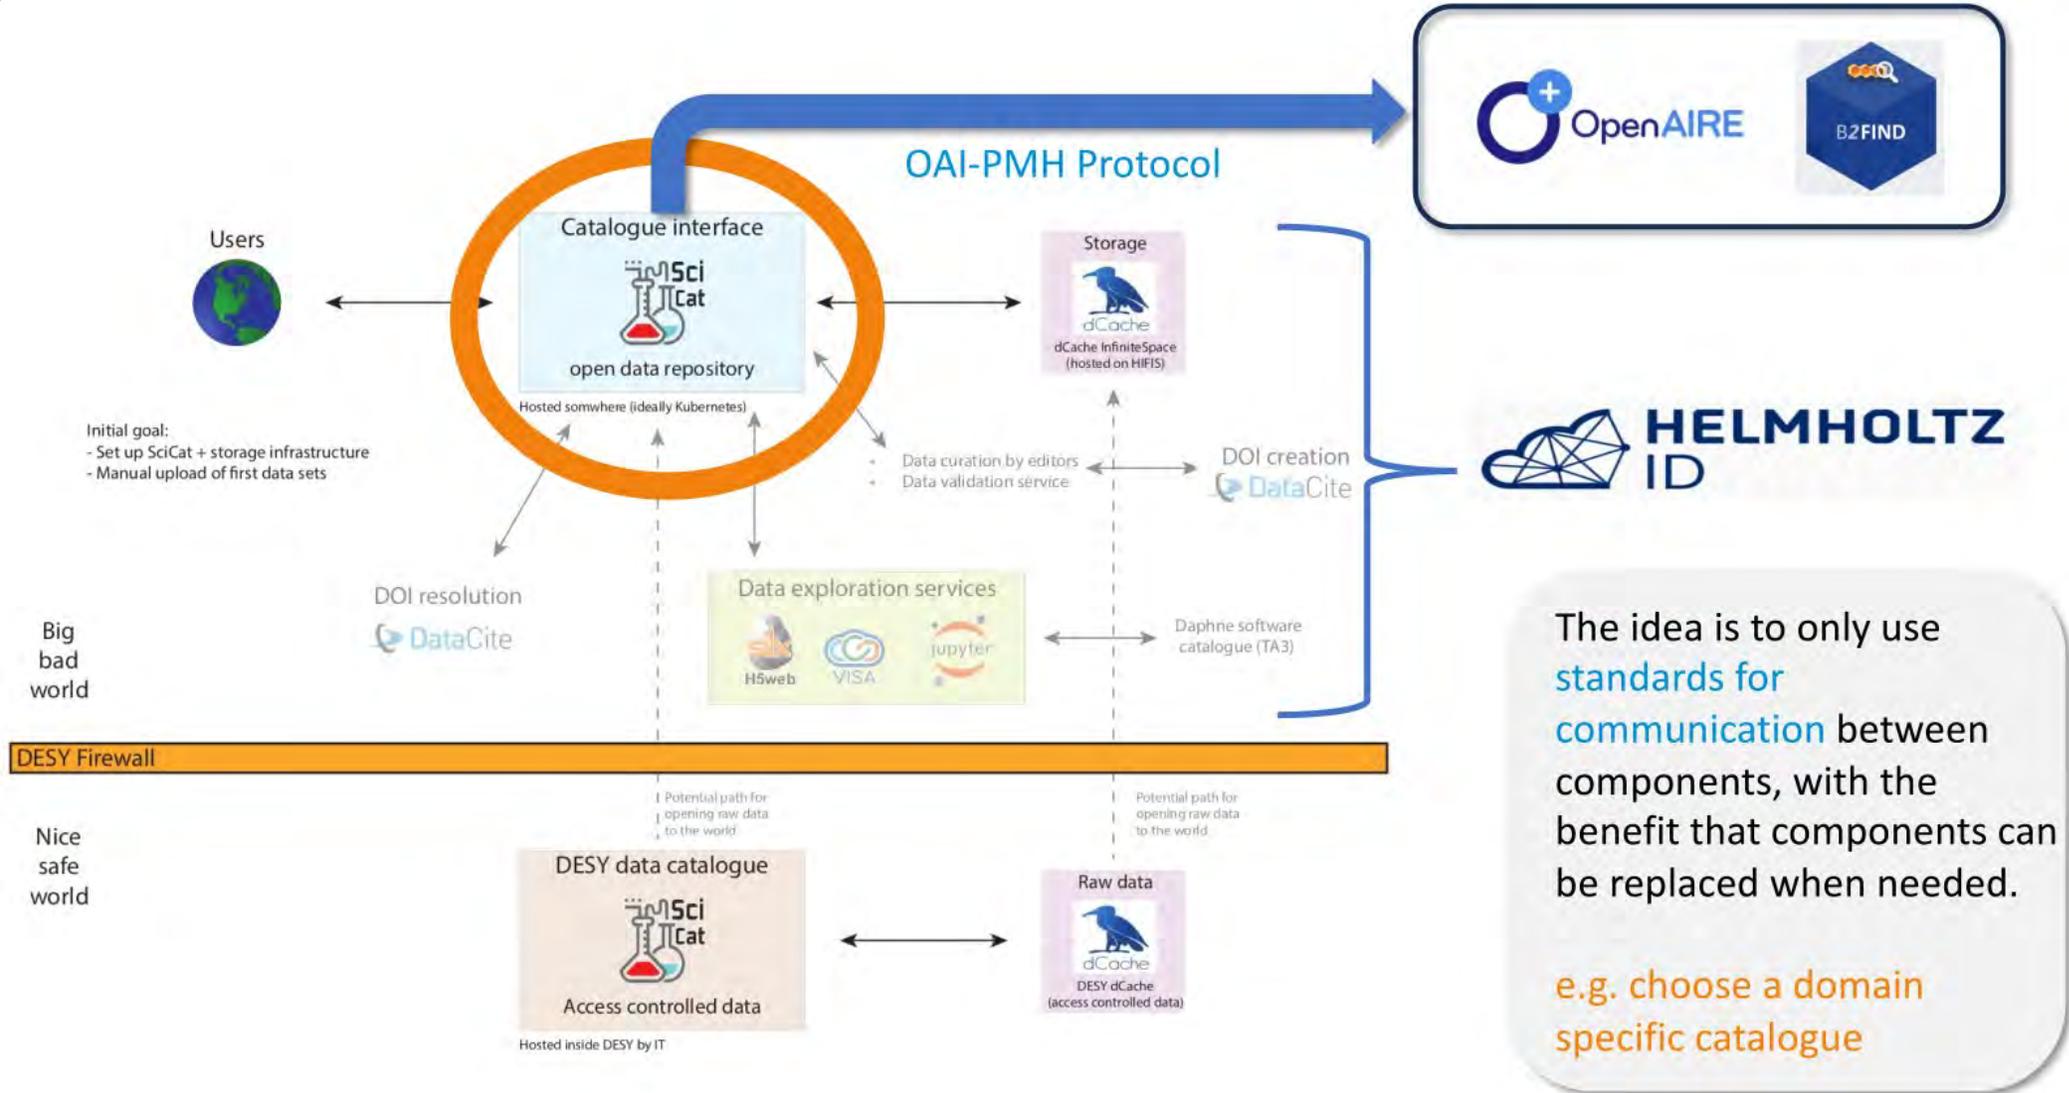

- Need to be provided by the specific communities
 - e.g. former ExPaNDS/PaNOSC, DAPHNE4NFDI, Photon Science Community

In parallel to Open Metadata

- Additional **specific information** might be required at
 - Beamline level
 - Facility level

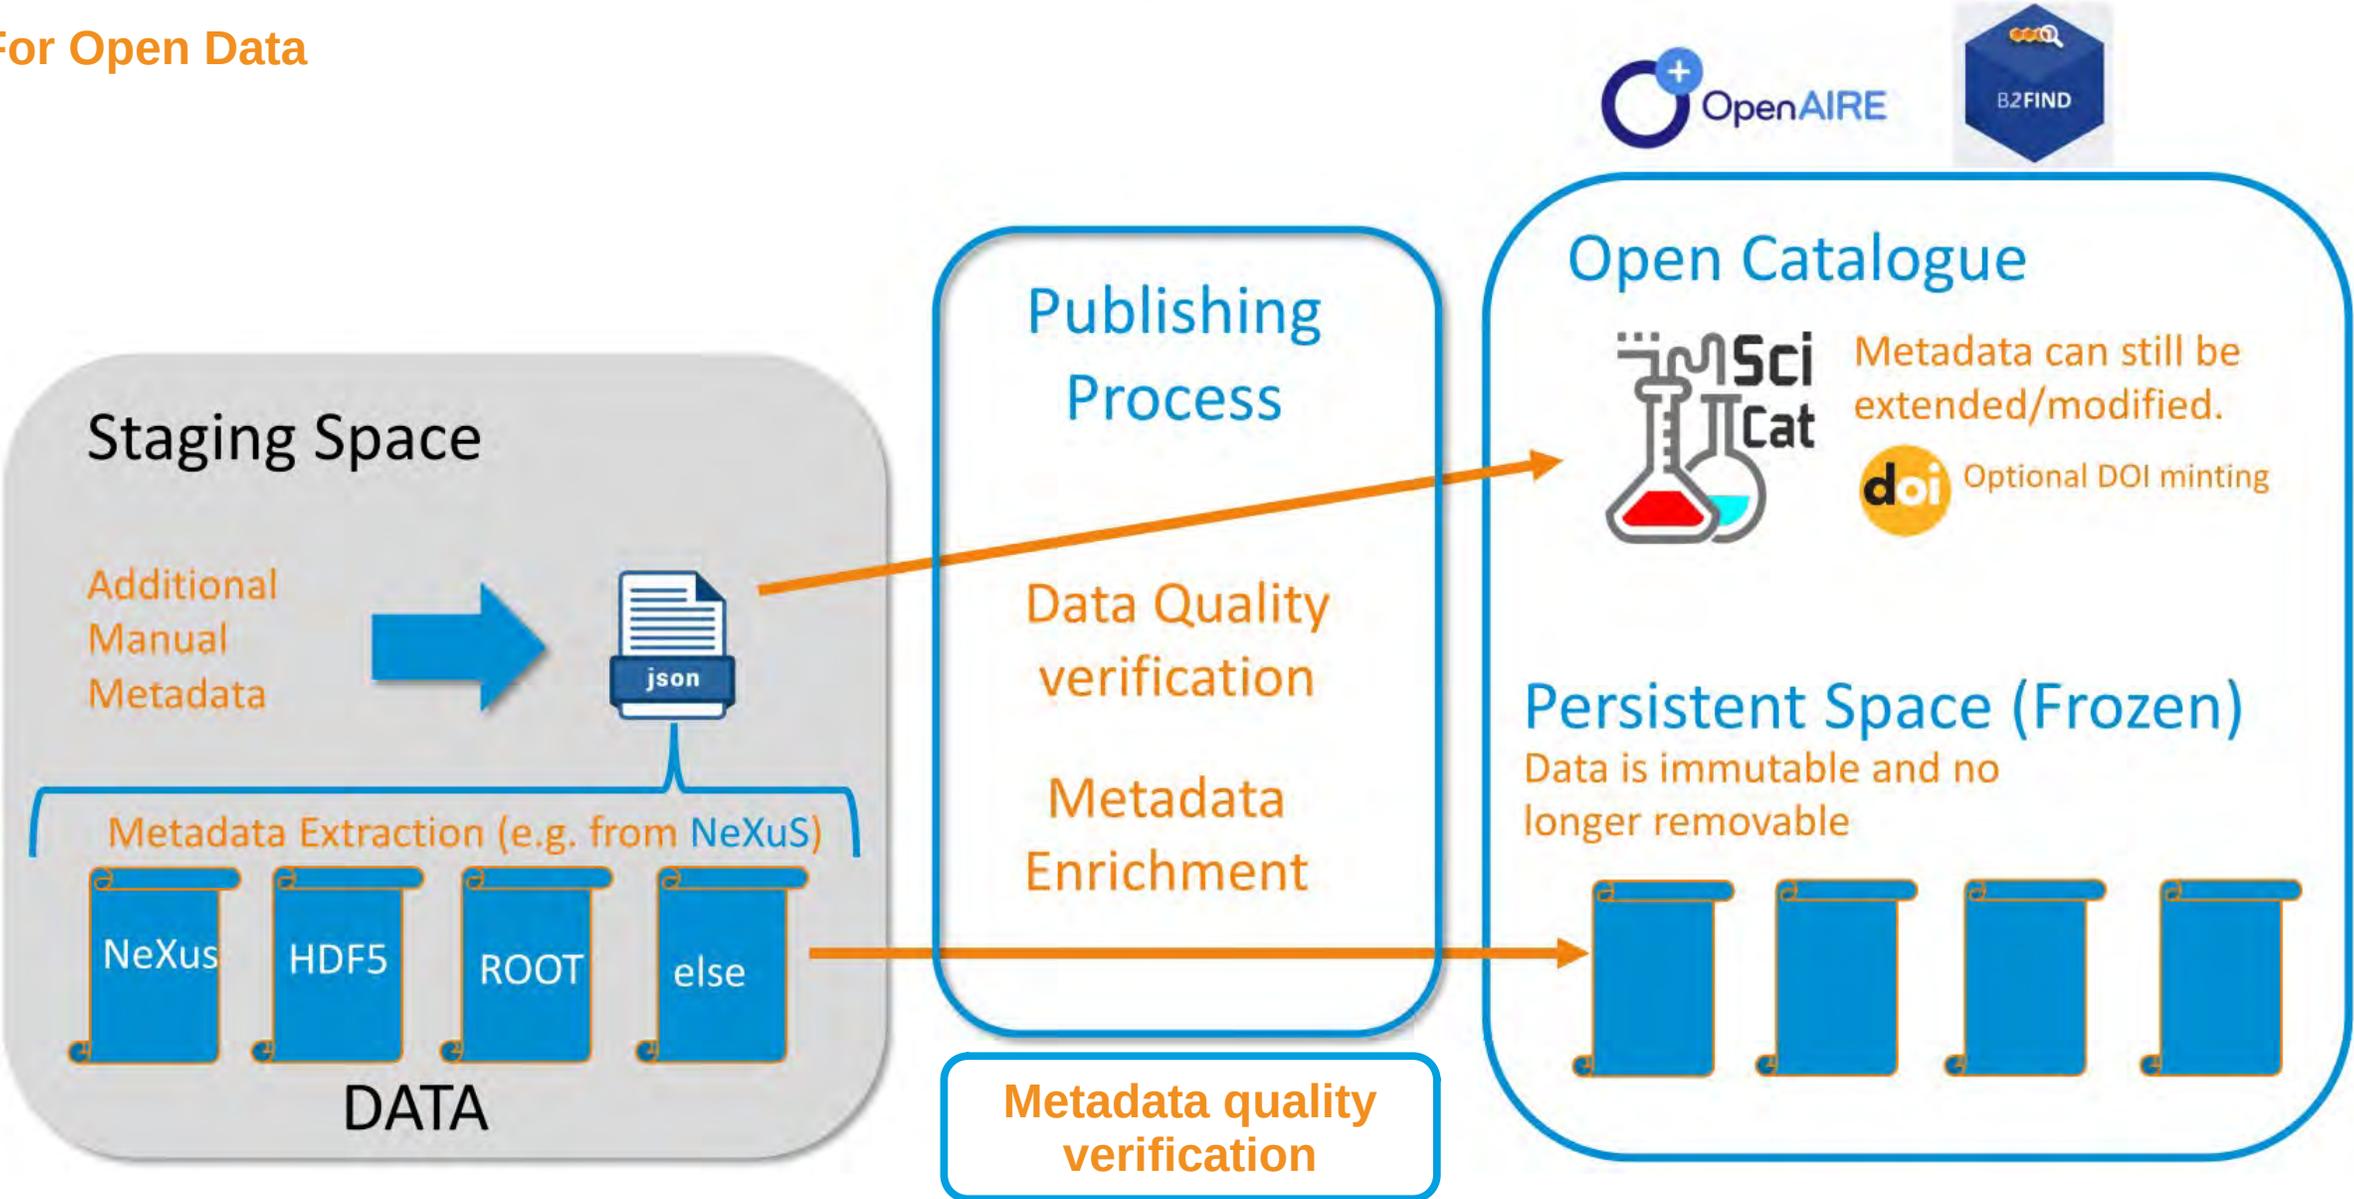

Photon Science setup

A high-level view of the world

Our envisioned data ingestion process

For Open Data

Our envisioned data ingestion process

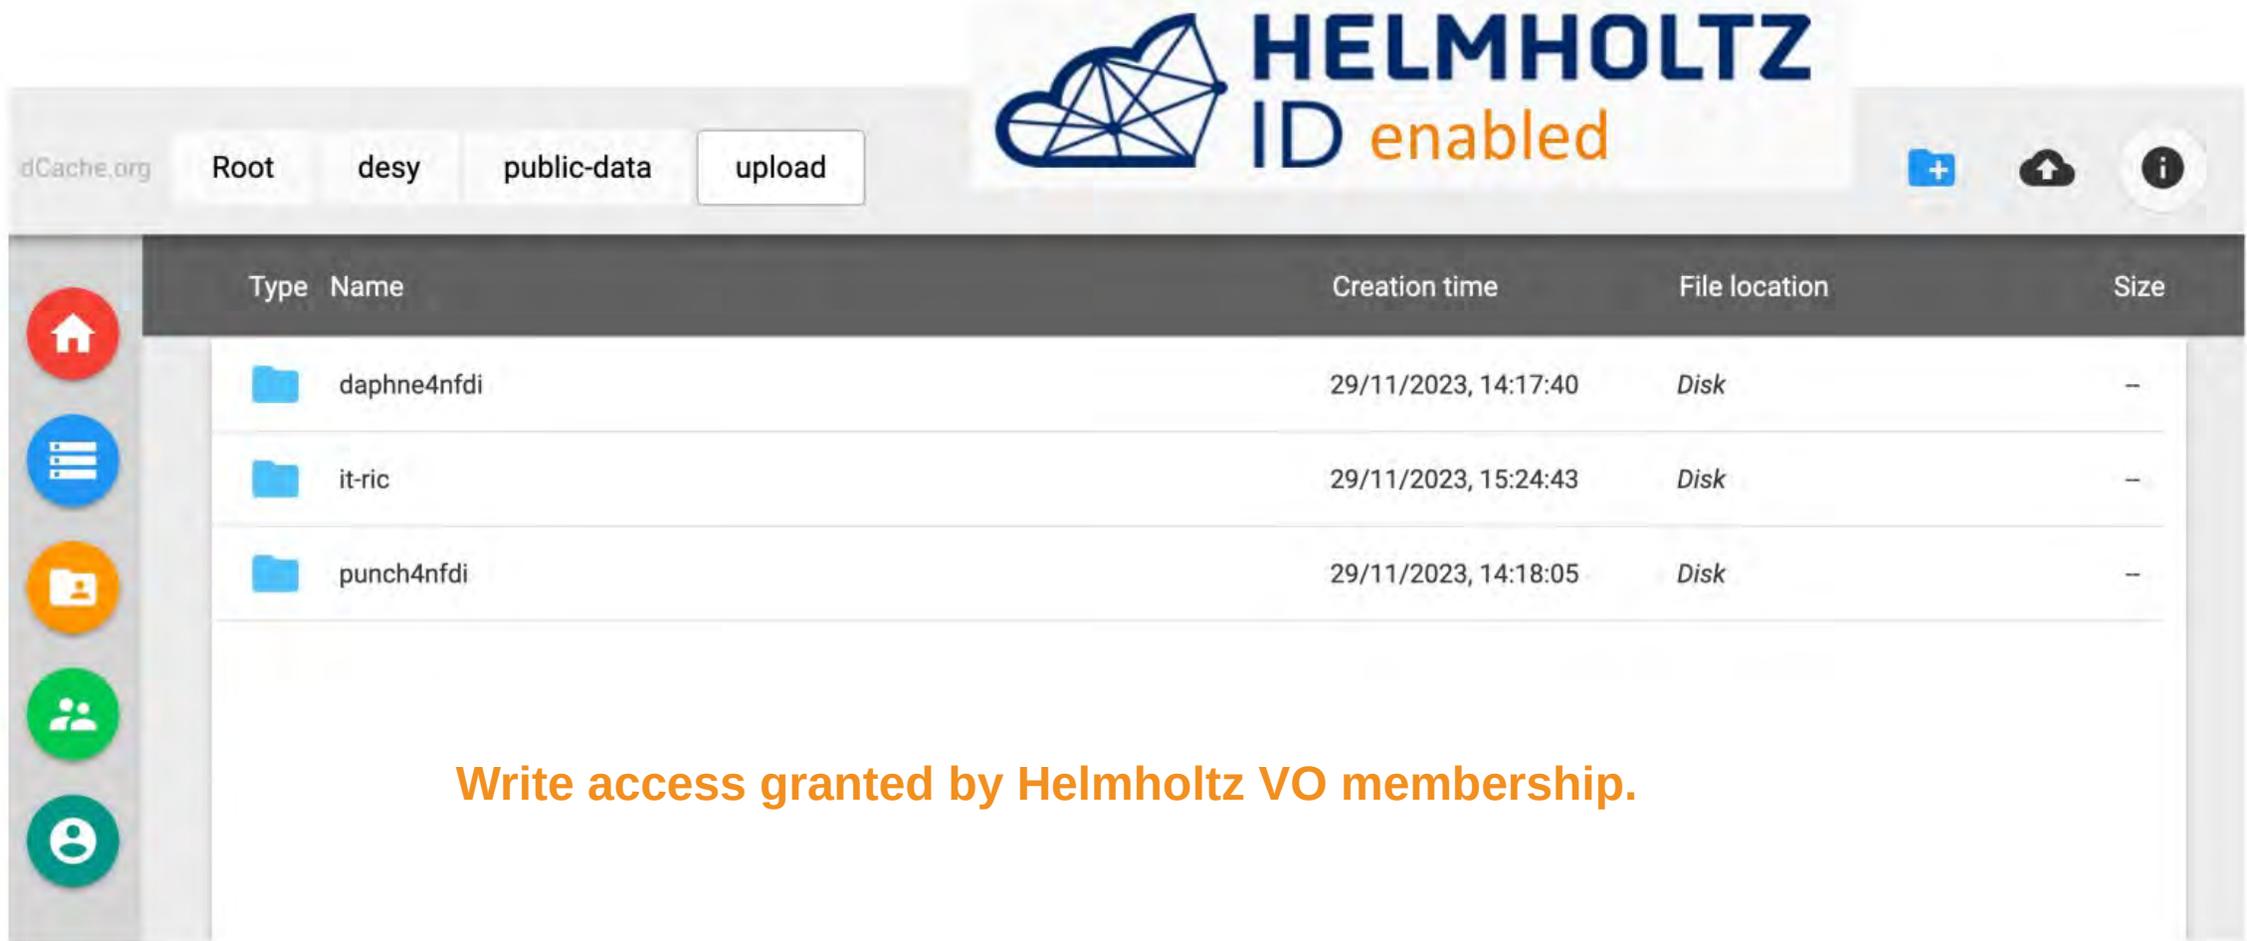

Metadata quality verification

- First installment with LinkML
 - <https://gitlab.desy.de/ric/opendata-metadata/>
 - Metadata schema description via YAML documents setting standards that metadata has to conform to
 - Data description in terms of “classes” and “slots”, allowing inheritance and mixins for creating custom types
 - 60+ different open-source tools to work with schemata for introspection, validation, format conversion, ...
- Starting with two public data use-cases
 - XAS & SFX
 - Integration into Gitlab CI/CD pipeline for linting, generating documentation and JSON-Schema
- If you are interested in details:
 - Let me know and I can get you into contact with my colleagues

The screenshot shows a web form for a metadata entry. At the top, there is a label 'Pressure [bar]' and a unit 'bar' in the top right corner. Below the label is a text input field containing the value 'bar'. Underneath the input field is a description: 'The sample pressure in bar.'. Below this is a section titled 'Characteristics*' with a subtitle 'Various characteristics of the sample'. Underneath is a 'Description' field with the text 'A free-form description of the sample characteristics'. Below the description field is a list of sample characteristics: 'solid', 'liquid', 'powder', 'single_crystal', 'thin_film', and 'in_situ'. The 'solid' option is selected and highlighted in blue. At the bottom, there is a dropdown menu labeled 'Type' with 'solid' selected. Below the dropdown is the text 'The form in which the sample is offered to the beam:'.

hifis-storage.desy.de

The “drop box” and and final storage space for Open Data

The screenshot shows the web interface for hifis-storage.desy.de. At the top, there is a navigation bar with the text "dCache.org", "Root", "desy", "public-data", and "upload". To the right of the navigation bar is the Helmholtz ID logo, which consists of a blue geometric shape and the text "HELMHOLTZ ID enabled". Further right are three icons: a blue plus sign, a black cloud with an upward arrow, and a black circle with an 'i'.

Below the navigation bar is a table with the following columns: Type, Name, Creation time, File location, and Size. The table contains three rows, each representing a folder:

Type	Name	Creation time	File location	Size
Folder	daphne4nfdi	29/11/2023, 14:17:40	Disk	-
Folder	it-ric	29/11/2023, 15:24:43	Disk	-
Folder	punch4nfdi	29/11/2023, 14:18:05	Disk	-

Below the table, the text "Write access granted by Helmholtz VO membership." is displayed in orange.

public-data.desy.de

The metadata catalog!

The image displays the public-data.desy.de metadata catalog interface. On the left, there are search filters for PID, Text Search, Location, Group, Type, Keywords, and Start Date - End Date, along with an "Add Condition" button. The main search results area shows a table with columns for Name and Source Folder. One result is highlighted: "Reflectometry curves (XRR and NR) and corresponding fits for machine learning" with source folder "...do.6497438".

A detailed view of this entry is shown in the center, divided into sections: General Information, Creator Information, and File Information. The General Information section includes Name, Description, PID, Type, Creation Time, and Keywords. The Creator Information section includes Owner, Principal Investigator, Contact Email, Owner Group, and Access Groups. The File Information section shows the Source Folder path.

On the right, a "Scientific Metadata" panel displays a table of metadata for two different DIPs (DIP_1 and DIP_2). The table includes fields like Experimentalists, Layer_CAS, Layer_formula, Layer_material, Substrate_temperature, instrument, q_max_fit, and year_experiment.

Below the detailed view, a file list is shown with columns for Path and Size. The files listed are:

Path	Size
calc_xrr.py	2 KB
conda_env.yml	7 KB
prepare_plot.py	4 KB
README.html	6 MB
README.ipynb	9 MB
requirements.txt	76 B
xrr_dataset.h5	254 KB

Computing Environment

Choose an environment

VISA_Apptainer
VISA image with Apptainer (former Singularity) preinstalled.

VISA_CrystFEL
VISA Image with latest CrystFEL installed.

Choose hardware requirements

4 Cores
8GB memory
Large

8 Cores
16GB memory
XLarge

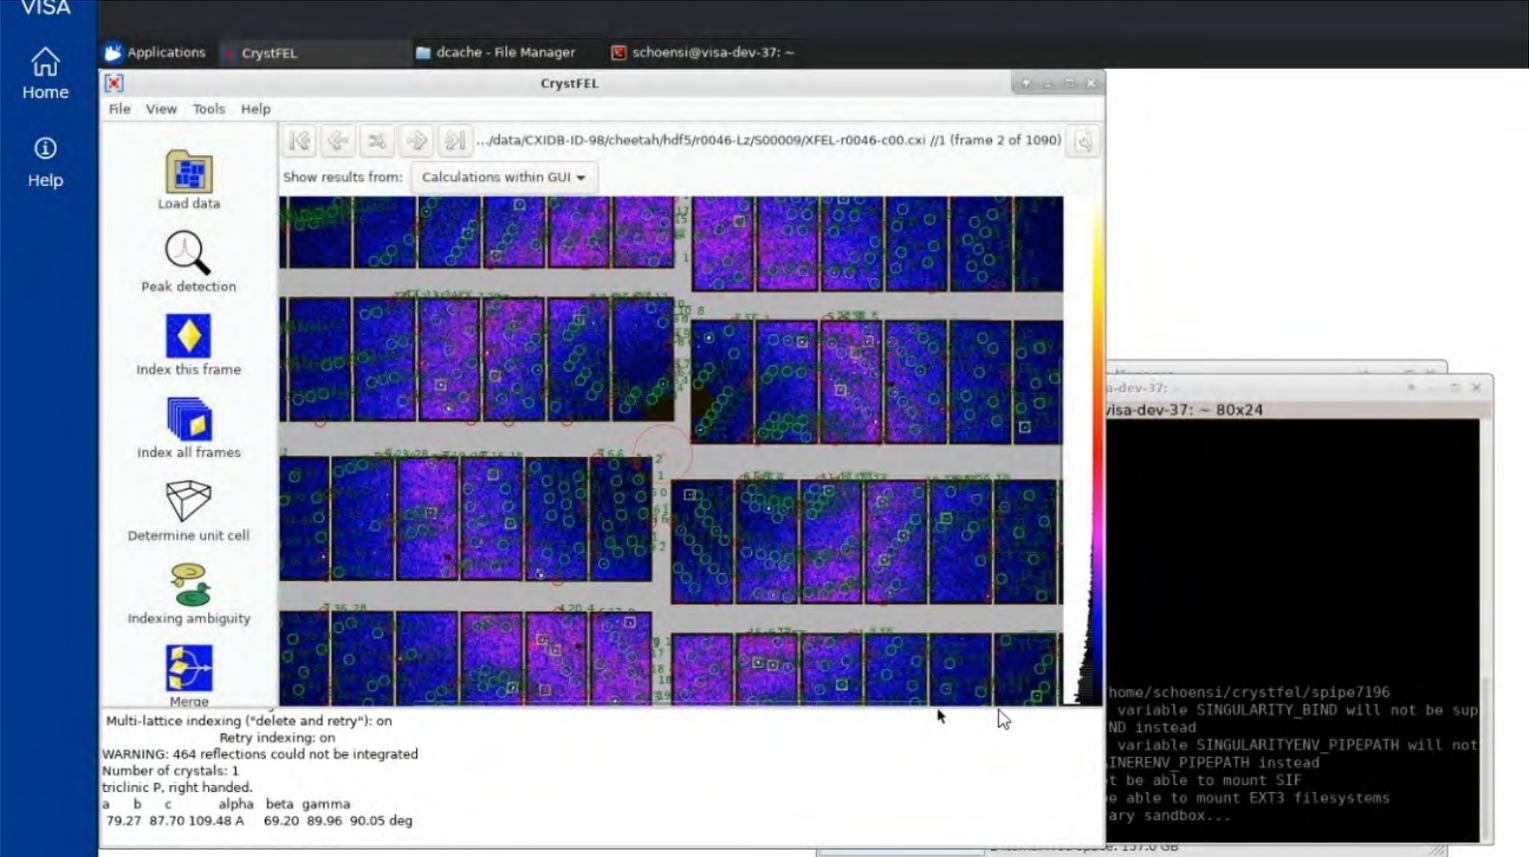

VISA database currently populated with example datasets.

Open Data to be integrated during 2024 via automated data export from public-data.desy.de

Work via remote desktop connection with graphical interfaces

Using CrystFEL Docker Images to run Singularity Container and work with Crystfel 10 Graphical Interface.

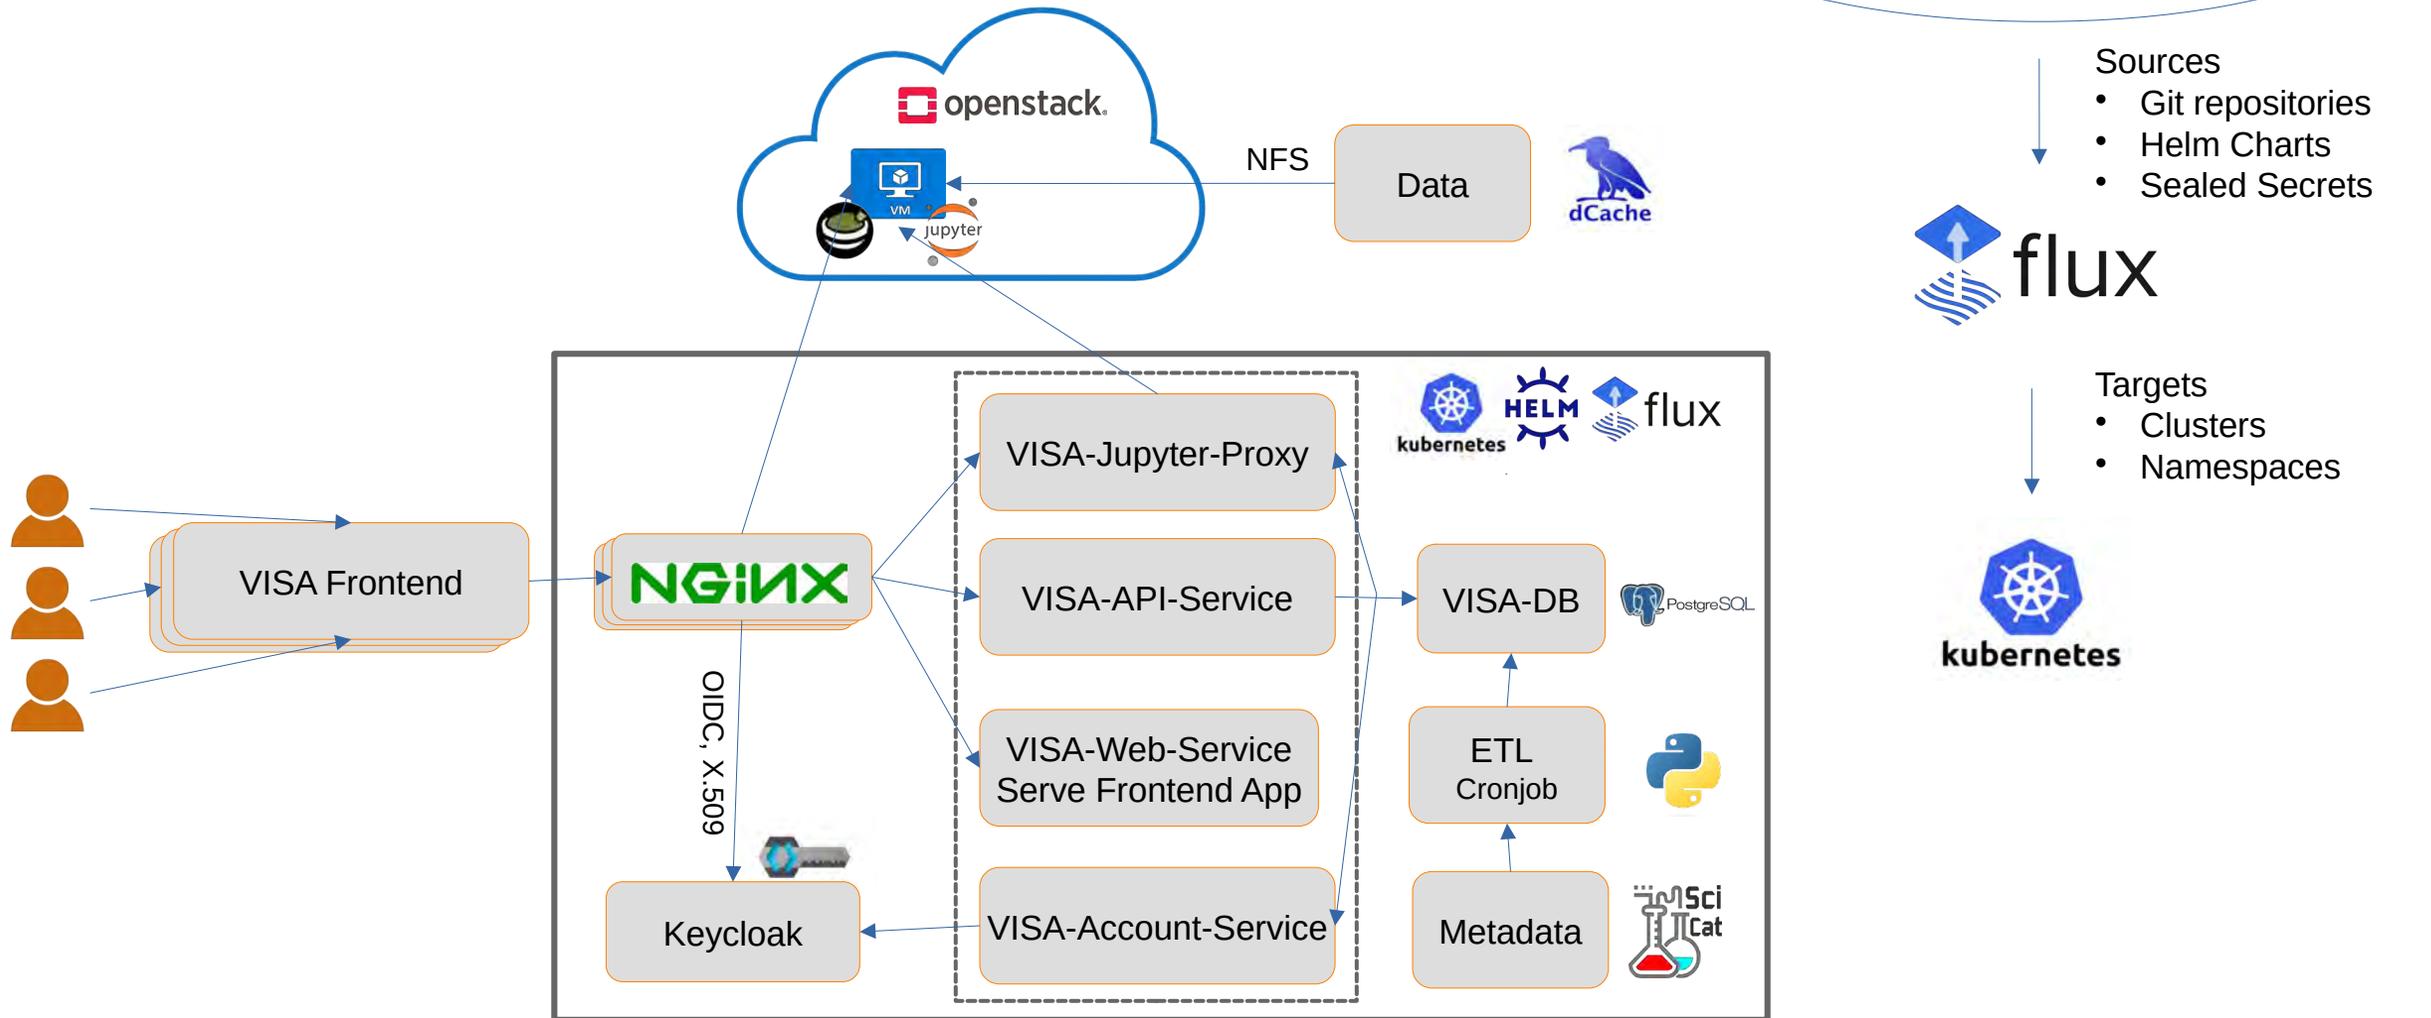

Example by Silvan Schön
(DESY/FS-SC)

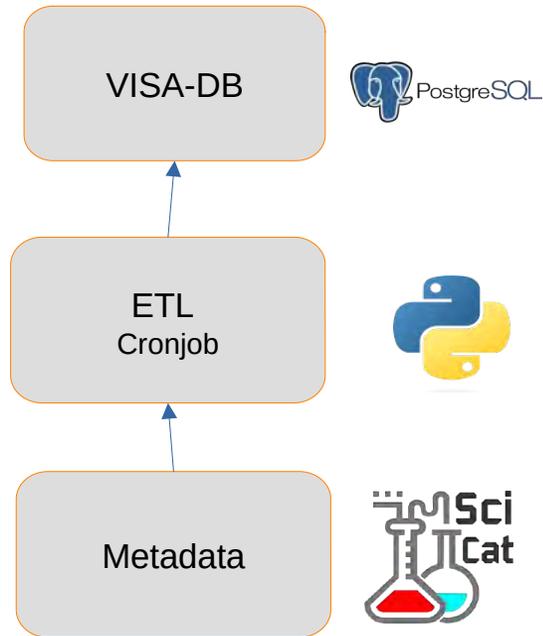

The screenshot displays a remote desktop session. On the left is a blue sidebar with 'VISA', 'Home', and 'Help' icons. The main window is titled 'CrystFEL' and shows a grid of diffraction images with overlaid spots and a color scale on the right. A terminal window in the bottom right corner shows the following output:

```
home/schoensi/crystfel/spipe7196
variable SINGULARITY_BIND will not be sup
ND instead
variable SINGULARITYENV_PIPEPATH will not
INERENV PIPEPATH instead
t be able to mount SIF
be able to mount EXT3 filesystems
ary sandbox...
```

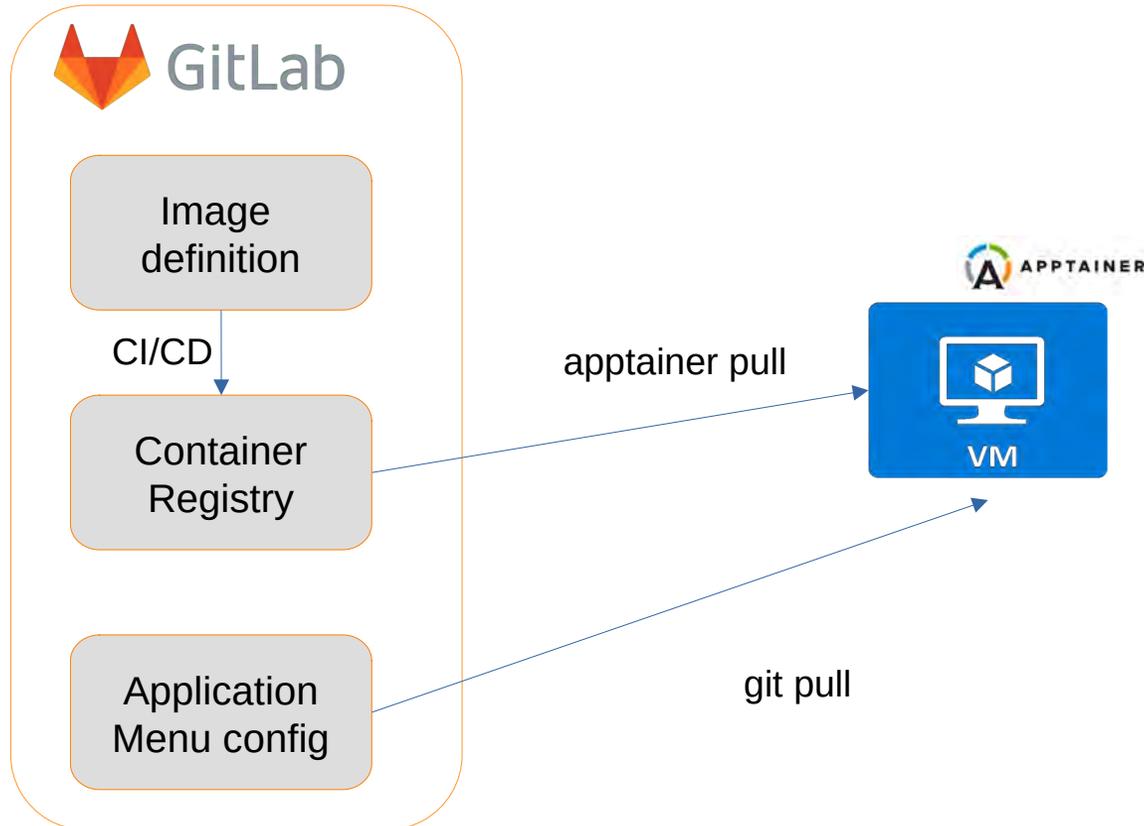

Metadata import via custom ETL process

- Python script
- Customizable depending on the metadata source (catalogue API format, authN/Z, ...)
- Can be run once for static data or as a cronjob for dynamic data
- Event-based execution would be nice to have (e.g. webhooks)

- Metadata import
 - Experimental specifications
 - Dataset status (embargoed or public)
 - User access rights
 - Storage paths

- Database backup

- Software in Apptainer images
 - Many applications already available as Apptainer image from HPC workflows
- Built from .def file in CI/CD pipeline
- Image publicly available in Gitlab registry
- Pulled on application startup

- Application menu entries defined separately in git repository
- Seamless integration into the OS applications
- Menu entries updated from menu config by cronjob pulls the repository regularly
- Seamless updates to the menu by admins

Open Data for DESY Photon Science

Summary

- Open Infrastructure Portal consisting of
 - **Scicat** as metadata catalog
 - **dCache** as storage system
 - **VISA** as data exploration and analysis portal
- Locally deployed and accessible via federated AAI with standard protocols
- Scicat as “single source of truth” w.r.t. storage locations and metadata
- Easy data dropping and long term storage via dCache
- Integration with VISA for remote data exploration and analysis
 - Allows reviewers to easily access data sets for publication reviews
 - Data value assessment before download
- Going forward this year to unfold its full potential and create a blueprint for a HIFIS service that could be adopted by interested Helmholtz centres and other institutions

Thank you

Digital image challenges and solutions along the pipeline

How do we achieve replicable image analysis solutions across domains?

1. **Observe and collect** challenges and solutions
2. **Assess and manage** specific solutions
3. Beyond replicability - **Generalizing** solutions

**Observe and collect
challenges and solutions**

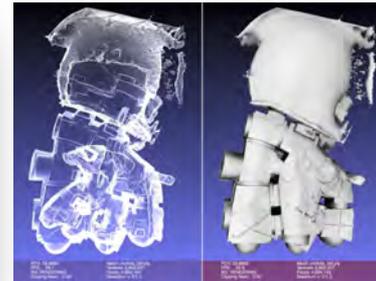

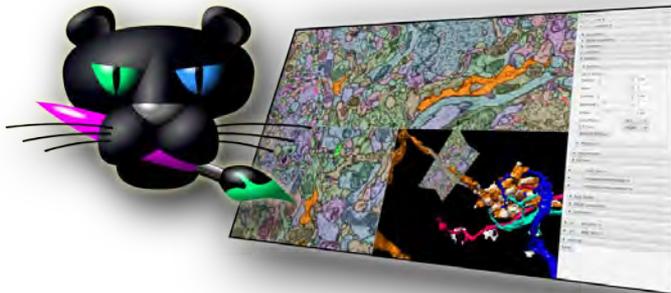

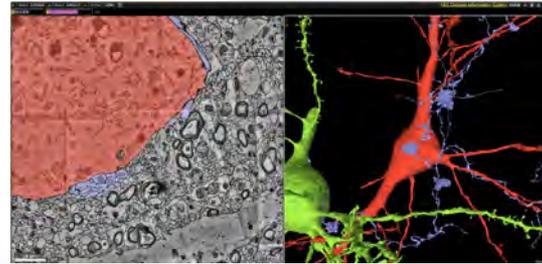

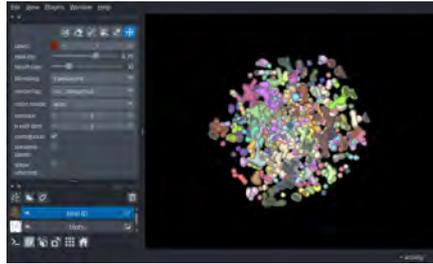

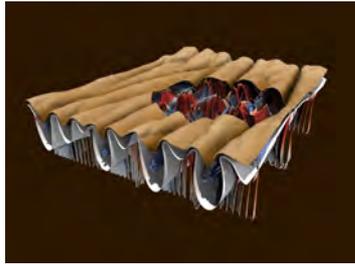

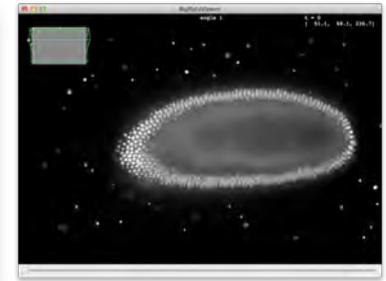

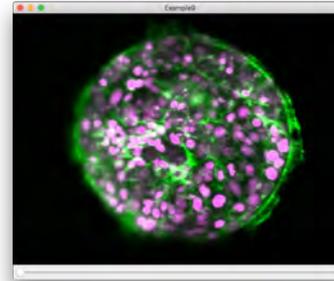

1. Observe and collect challenges and solutions

Abundance of diverse software solutions

Example: 3D Rendering Software

1. Observe and collect challenges and solutions

Helmholtz Imaging Connect

Modalities

A type of imaging technique that utilizes a certain physical mechanism to measure a quantity. Imaging modalities can be categorized by the method in which images are generated (ultrasound, light, electrons, lasers, X-rays, ultrasound, nuclear magnetic resonance, etc) and by some imaging particularity. For example, X-ray could include X-ray microtomography, X-ray crystallography and X-ray spectroscopy.

Applications

The object of study of a scientific field or a research field.

Instruments

A device used for making measurements, alone or in conjunction with one or more supplementary devices. A set of instruments belonging to the same platform can be grouped in a facility.

Centers

As Helmholtz Imaging is founded by the Helmholtz association, only the eighteen Helmholtz centers are referenced in the database. In case of missing center, please contact our Helmholtz Imaging Service Team at DESY Hamburg.

Labs

A lab is a collection of scientists, usually working in a team, usually at the same place having a teamleader. Here a lab can also be a virtual lab, being a consortium of people collaborating.

Facilities

A set of instruments combined to form an scientific or administrative unit.

Experts

All members of any of the Helmholtz Centers working with images, or on the development of methods for image processing or analysis, or are just interested in scientific imaging are considered Helmholtz Imaging Experts.

Solutions

A Solution in Helmholtz Imaging Modalities can be any kind of solution to an imaging challenge. Mostly this will be a software solution (executable software/algorithm/pipeline ...) or a dataset of images. But also a whitepaper describing the solution to a reoccurring imaging challenge can be listed here. This category also includes those solutions, which are installable via the Album catalogue of Helmholtz imaging.

 Roman (*en*)

Period type political

Digital provenance chronOntology

Description
 The great Latin historian Tacitus opens his Annals with a deft summary of the evolution of the Roman state, beginning with the words 'The city of Rome was, from the start, ruled by kings'. As his words suggest, Roman periodicization of Roman history was based on forms of government, basically: immediately after Rome's foundation (traditionally, in 753 BC, rule by kings (the 'regal' period); next (traditionally, from 509 BC) rule by a Republic (aristocratic, not democratic, but nonetheless obedient to regularly elected officials: 'magistrates'); and finally (from 27 BC) rule by emperors (principes). Modern historians follow suit, and subdivide both Republican and Imperial history into 'early', 'middle' and 'late' periods, thus referring to the 'Early' Republic, the 'High' Republic and the 'Late' Republic, and to the 'Early', 'High' and 'Late' Empire. The distinction between 'Republic' and 'Empire' can be a Role confining to newcomers, because Rome's empire was for the most part a Republican creation. However, it works well enough, and is here to stay. A further complication is that there is lively debate as to the specific dates of some of these periods: when did the Early Republic end, or the Late Empire begin?

„Palmyra GIS“ - Digitaler Kulturerhalt in Syrien

Forschende des Deutschen Archäologischen Instituts haben die digitale webbasierte Anwendung „Palmyra GIS“ entwickelt. Mit der Anwendung und dem dazugehörigen 3D-Druck des Geländemodells der syrischen antiken Ruinenstadt Palmyra möchten die Forschenden zum Schutz des durch den syrischen Krieg gefährdeten Weltkulturerbes beitragen.

Auf Basis eines geographischen Informationssystems (GIS) erstellten Dr. Benjamin Ducke und sein Team die Anwendung „Palmyra GIS“. Es kombiniert kartographische Werkzeuge mit einer flexiblen Datenbank. Nutzer haben nun Gelegenheit über eine webbasierten Benutzeroberfläche auf die Daten zuzugreifen. In den letzten Jahren trugen Forschende unter anderem große Mengen von Fotos, Karten und Luftbilder zusammen. Forschende des DAI digitalisierten analoge Datensätze oder erstellten neue digitale Daten, die nun erstmals zugänglich sind. Kartengrundlage von „Palmyra GIS“ ist eine erweiterte digitale Version der Karte „Topographia Palmyrena“, die Klaus Schnädelbach (TU München) 2010 in Zusammenarbeit mit der Außenstelle Damaskus des DAI publizierte. Die gesammelten Daten sind nun mit dieser digitalen Version der Karte verknüpft und bilden eine einmalige und umfassende Sammlung detaillierter geographischer Daten zu Palmyra.

Die webbasierte Anwendung „Palmyra GIS“

Dank verschiedener Benutzeroberflächen kann es von Fachleuten und fachfremden Personen genutzt werden. NutzerInnen können durch Verlinkungen auf der digitalen Karte auf Fotos, Pläne und Textinformationen aus der großen Sammlung des DAI zugreifen. Alle wichtigen Monumente sind mit der DAI Online-Datenbank auf verbunden.

Online-Journals and Digitized Journals of the DAI

Journals

Archäologischer Anzeiger

In *Archäologischer Anzeiger* (AA) short notifications are published regarding current researches and reports on excavation projects conducted by the German Archaeological Institute (DAI) as well as by colleagues around the world. The journal focusses on topics of the Mediterranean area covering periods from prehistory to late antiquity, furthermore projects outside the ancient world are considered. In accordance with the journal's scope and the research practice of the department, contributions to the *Archäologischer Anzeiger* are also welcome that discuss the large-scale connections and networks of the ancient world to the northern European, Eurasian and African regions.

The quality of the *Archäologischer Anzeiger* is guaranteed by a double blind peer-review process as well as thorough text and image editing. From half-volume 2019/1 onwards, the contributions will be accessible over a responsive viewer format and a PDF as open access in addition to the printed version.

The Forgotten Kingdom

New investigations in the prehistory of Eswatini

GREGOR D. BADER, BOB FORRESTER, LISA EHLERS, ELIZABETH VELLIKY, BRANDI L. MACDONALD, JÖRG LINSTÄDTER

Introduction

1 The [Kingdom of Eswatini](#) is sandwiched between [South Africa](#) and [Mozambique](#) (Fig. 1). Physiographically, the landlocked country is subdivided into the Highveld in the west, the Middleveld in the centre, the Low Veld in the east and the narrow, elevated [Lubombo Mountain](#) range at the eastern border with Mozambique. The drop in elevation from the western Highveld to just above sea level in the east generates a wide range of ecozones in a surprisingly small geographic area.

2 Although archaeological research in neighbouring South Africa had been conducted since the beginning of the 20th century ([Goodwin – van Riet Lowe 1929](#)), Eswatini received little attention until the 1960s when Peter Beaumont conducted intensive field work there. Among the most celebrated of his sites are [Castle Cavern](#), [Banda Cavern](#) and [Lion Cavern](#), all situated within or around the modern [Ngwenya iron ore mine](#) (Fig. 2), originally known as Bomvu Ridge before modern mining operations started. A Middle Stone Age (MSA) radiocarbon date of 43,000 years BP came from the bottom of the archaeological sequence for Lion Cavern. Evidence for intentional ochre mining on the walls and bedrock (Fig. 3) indicated Lion Cavern to potentially be the oldest ochre mine in the world ([Dart – Beaumont 1971](#), [Boshier – Beaumont 1972](#)).

3 The Ngwenya sites are the tip of the iceberg in archaeological terms. Between 1965 and 1967, Beaumont investigated more than 100 archaeological sites in Eswatini and excavated several of them. These demonstrated the deep history of hominin occupations spanning the Early Stone Age to the Iron Age (Beaumont's field notes). However, very little of his work ever reached the public. After the early 1970s, Beaumont left Eswatini and started excavations at [Border Cave](#) ([Beaumont 1978](#)). As a consequence no archaeological excavations were conducted at Eswatini anymore and the country faded away from archaeological prominence.

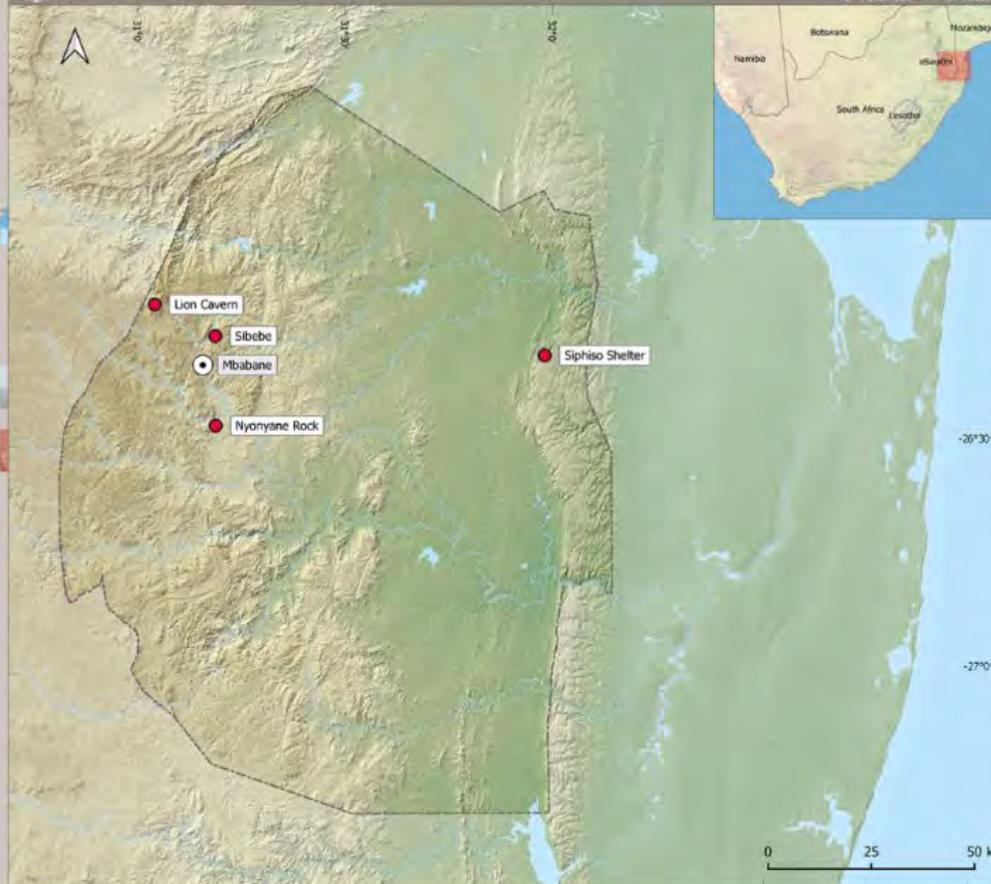

4 David Price Williams rediscovered the archaeological potential of Eswatini by chance. Coming from Britain – and married to a Swazi – he met her family for the first time on a Christmas holiday visit to Eswatini during the mid-seventies ([Price Williams 2016](#)). After a visit to the [Nsantwini](#) rock art site, Price Williams fell in love with the country. He established the Swaziland Archaeological Research Association (SARA) and spent three to four months in Eswatini every southern hemisphere winter, along with his family. For more than a decade, Price Williams conducted exemplary research in Eswatini, using modern excavation techniques on an innovative and interdisciplinary scale.

5 Among the most famous excavated sites are [Sibebe](#) ([Price Williams 1981](#)), [Siphiso](#) and [Nyonyane](#) ([Barham 1989a](#), [Barham 1989b](#)) (Fig. 1). As we found out recently though, by going through his collections in the National Museum, he documented and excavated more than 80 archaeological sites. Some of these were recorded in Beaumont's time, while others were completely new. However, when Price Williams left Eswatini in 1989, the majority of them remained unstudied or unpublished. The large SARA collection remained stored in the [Eswatini National Museum](#) at [Lobamba](#), unseen by the archaeological community. Once again, Eswatini was forgotten, this time for 27 years. This is particularly astonishing as Stone Age research in neighbouring South Africa was flourishing at that time.

Objectives

6 In 2016, our team started a new project in Eswatini. The primary objective was to screen the SARA collections, evaluate the quality of their documentation, and survey the country for new research opportunities. After the first campaign, we were overwhelmed by the possibilities. We began with a comprehensive, digital inventory of the Price Williams collection and conducted field surveys. Soon, our interest in the ancient mining activities at

publications

was retrieved from C^{14} dating on charcoal in 1971. We calibrated this sample using OxCal 4.4 to between 46,707 and 45,886 calBP. The beginning of mining at Lion Cavern however could be even older, reaching beyond the C^{14} limit. Furthermore, the publications containing the old dates lacked any illustrations or descriptions of the mining associated archaeological assemblages, apart from Beaumont's note of "mining tools" (Dart - Beaumont 1971).

7 On a broader scale, the presence of Ngwenya as a high-quality ochre source made us curious to find out more about the red earth pigment. Ochre plays a major role in Stone Age research in southern Africa due to its duality in meaning covering both functional and symbolic aspects. The earliest intentional use is documented from *Twyn Rivers* in Zambia dating back between 350,000 and 195,000 BP (Barham 1998; Barham 2002). Since then ochre use is evident throughout the MSA, Later Stone Age (LSA) up to the Iron Age (IA) and into modern times. The well-known geometric engravings on an ochre piece from *Blombos cave* dating to the *Still Bay* (Henshilwood et al. 2001) were interpreted as one of the earliest expressions of symbolism. Among others, the use of ochre and symbolism was associated with the origins of language (Watts 2009). However, ochre might have had functional value as well. Some researchers indicated that ochre powder could have been used as sunscreen (Rifkin et al. 2015) or for tanning animal hides (Rifkin 2011). Furthermore, ochre was also tested to be highly effective as a loading agent in mastics (Wadley 2005; Wadley - Williamson - Lombard 2004; Wadley - Hodgskiss - Grant 2009). However, apart from few published results from South Africa (e.g. Daye et al. 2015) we know little about the procurement strategies and transport distances of the red earth pigment. Lion Cavern and Eswatini in general thus would play a crucial role for the investigation of these aspects.

8 In 2019, a project funded by the Deutsche Forschungsgemeinschaft (DFG - BA 6479/2-1) was awarded to us to test Lion Cavern for remaining archaeological deposits. We decided to excavate the site and collect new dating samples. Simultaneously, we decided to conduct a broad scale geochemical ochre tracing project in the country using neutron activation analysis and inductively coupled plasma-mass spectrometry on both archaeological and geological samples from Ngwenya and other sources of ochre in the region.

Preliminary results

9 We were able to detect a 4 m intact archaeological sequence at Lion Cavern which had been exposed by modern mining activities in the 1970s (Fig. 4). Although chances are high that this profile is connected to Beaumont's excavation area, we cannot be sure at the moment due to massive loads of rubble in between. Therefore, we call this provisionally Lion Cavern II (LCII). At the bottom of the sequence from LCII typical MSA tools are eroding out of the profile (Fig. 5).

10 We took four sediment samples for optically stimulated luminescence dating in equal distances from top to bottom which are currently under examination at the *Cologne Luminescence Laboratory*. Higher above LCII we found another cavity filled with sediments which we call Lion Cavern III (LCIII) (Fig. 2). In the profile of LCIII we found two overlying bands of charcoal which were dated to 12,556 - 12,400 (BETA - 541999) and 12,160 - 11,940 cal BP (BETA - 541998) indicating that this part of the mine was used during the Late Pleistocene LSA. For the ochre tracing project, we selected 346 ochre pieces out of the collections from Sibebe, Siphiso, Nyonyane, *Mlawula I & II* and *Nsangwini* (Fig. 6). For the geological comparative collection, we systematically collected several dozen samples from Lion Cavern and across the extensive Ngwenya iron deposit, and another two dozen from two newly discovered  at *Bulembu* and *Piggs Peak*. The provenance analysis is currently underway at the *Archaeometry Laboratory at the University of Missouri*. Preliminary results suggest though that the geological sources of ochre that we sampled are highly distinct and can be linked with large confidence to archaeological pieces.

Future perspectives

11 Our research at Lion Cavern and on ochre provenance is only the beginning of a long-term project in Eswatini focusing on questions of cultural evolution and modern human behaviour on a timeline from the MSA to the Iron Age. With the help of Bob Forrester, who spent a significant amount of time with John Masson surveying the country, we know of about 100 archaeological sites, many of them with rock art and archaeological deposits. Together with our colleagues from the *Dawarini National Trust Commission* (ENTC) we will intensify our research on the old Price Williams collection and conduct new excavations at Lion Cavern and at other selected sites in different parts of the country. We hope to fill gaps of knowledge about the history of ancient human behaviour in this part of Africa.

Die Ausgrabungen in Boğazköy- Hattuša 2018

Die Arbeiten im hethitischen Stadtgebiet

Ausgrabungen in der nördlichen Unterstadt

1 2018 wurden die Arbeiten in der nördlichen Unterstadt mit dem Ziel fortgesetzt, die chronologische und städtebauliche Entwicklung dieses Stadtgebiets im Vergleich zu den bekannten Teilen der Altstadt weiter zu erforschen. Aufbauend auf den bisherigen Arbeiten [1] stand zunächst die Klärung der verbliebenen Bereiche eines monumentalen Gebäudes der hethitischen Phase im Fokus. Allerdings erbrachten die Grabungen in diesem Zusammenhang auch unerwartete Ergebnisse, die neue Einblicke nicht nur in die Struktur der hethitischen, sondern vor allem auch der *kārum*-zeitlichen Stadt ermöglichen (Abb. 1).

2 Sowohl im Süden als auch im Norden des monumentalen hethitischen Gebäudes konnten weitere Teile der *kārum*-zeitlichen Bebauung freigelegt werden. Während die Mauerzüge im Süden des Areals möglicherweise eine Einheit bilden, können zwei weitere Räume im Norden nicht unmittelbar angeschlossen werden (Abb. 1). Da alle Mauern dieser einzigen *kārum*-zeitlichen Bauschicht auf dem gewachsenen Boden errichtet und unmittelbar von den hethitischen Mauern überbaut wurden, sprechen die stratigraphischen Beobachtungen neben den C^{14} -Datierungen dafür [2], deren Erbauung als gleichzeitig anzusehen. Die einheitlichen Brandspuren deuten im Moment daraufhin, daß es sich ebenfalls um ein Ereignis handelt, ohne jedoch dieses datieren oder seine Ursache benennen zu können.

Domain specific SKGs

Objective

Combining domain and domain-agnostic **SKGs** and leveraging them to build **added-value services** that are **tailored for a particular domain** of interest

- **Discovery**
- **Reproducibility**
- **Research assessment**

Challenges

- **Heterogeneous formats:** unstructured files (e.g., textual data), databases and knowledge bases.
- **Non-English** texts are common in some domains
- **Diverse technical expertise** (e.g., graph & text mining) from domain-specific experts may be different or missing at different SKG sites
- **Lack of interoperability:** SKGs adopt different models also for the same entities
- **Scope:** domain-agnostic SKGs cannot cope with domain-specific idiosyncrasies

SciLake: the Vision

- Introducing an **open, transparent & customizable Scientific-Lake-as-a-Service**
 - Data lake hosting **domain-specific & domain-agnostic SKGs**
 - Facilitates sharing of **tools for SKG enrichment**
 - Facilitates the **creation of community-created SKGs** out of tools and other SKGs in the DataLake
 - Offers a **unified way to access & query** the contained assets.
- **Two discipline-tailored, added-value services** to facilitate:
 - **navigating** the respective vast knowledge space (exploiting indicators of **scientific impact**)
 - improving **research reproducibility** in the respective domain
- **Customise, test & demonstrate** the developed services in **real-world pilots.**
